Subject: Submittal of Preliminary Phase 1 Site Characterization Summary Report
Oak Grove Village Well Superfund Site - Operable Unit No. 2 (OU2)
City of Sullivan Landfill - Franklin County, Missouri
U.S. EPA Region 7, Docket No. CERCLA-07-2009-014

Dear Ms. Howell:

ARCADIS, on behalf of TRW Automotive U.S. LLC (TRW), is submitting the Preliminary Phase 1 Site Characterization Summary Report to the U.S. Environmental Protection Agency (EPA) pursuant to the Administrative Settlement Agreement and Order on Consent for Remedial Investigation/Feasibility Study (AOC) for the Oak Grove Village Well Superfund Site – Operable Unit No. 2. In addition, a copy of the Summary has been submitted to Ms. Candice McGhee of the Missouri Department of Natural Resources.

If you have questions or comments concerning the enclosed Work Plans, please contact the Project Coordinator, Mr. Paul Jack at (724) 275-7373.

Sincerely,

ARCADIS

John P. Shonfelt, P.G.
Senior Project Manager/Hydrogeologist

**Phase I Preliminary
Site Characterization
Summary Report**

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

1. Introduction

This Phase I Preliminary Site Characterization Summary Report (report) describes the implementation and findings of the Phase 1 Site Characterization, an environmental site investigation conducted between 2010 and 2012 to evaluate the City of Sullivan Landfill (Landfill), located in Operable Unit 2 (OU2) of the Oak Grove Village Well Superfund Site in Franklin County, Missouri. On behalf of TRW Automotive U.S. LLC (TRW), ARCADIS U.S., Inc. (ARCADIS) performed the Site Characterization at the Landfill in accordance with the Work Plan for Remedial Investigation and Feasibility Study (work plan [ARCADIS 2010]) and pursuant to the Administrative Settlement Agreement and Order on Consent for Remedial Investigation/Feasibility Study (AOC) between the United States Environmental Protection Agency (USEPA) and TRW. The USEPA signed the AOC on September 28, 2009.

Several terms describing locations are referred to throughout this report. For the purposes of this report, the following terms are defined below:

- **OU2** is an area designated by the AOC, is located to the northeast of Oak Grove Village, and includes the landfill and the La Jolla Spring Cave Complex (Figure 1-1).
- The **Landfill** comprises a 28-acre cell, perimeter roads, and property adjacent to the landfill fence line (Figure 1-2).
- The **Site** is the area defined in the AOC as the “city of Sullivan landfill and areas where contamination has come to be located.”
- **Site Investigation Area (SI Area)** describes the area that is the focus of sampling conducted during the Phase 1 Site characterization.

1.1 Purpose and Objectives

The Phase I Site characterization was completed to meet, in part or in full, the following objectives of the remedial investigation/feasibility study (RI/FS) process:

- Define the SI Area’s physiography, geology, and hydrology.
- Determine if the Landfill is a source area of constituents of potential concern (COPCs) in groundwater.
- Better define the surface and subsurface pathways of migration.

**Phase I Preliminary
Site Characterization
Summary Report**

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

- Collect data to better determine the extent of migration of COPCs to better understand the nature and extent of impacted groundwater at the SI Area.
- Assess the risk to human health and the environment based on historical and current data collection efforts (if necessary).
- Evaluate appropriate remedies (if necessary).

As prescribed by the AOC, the findings of the Phase 1 Site Characterization will determine whether additional phases of work are required to meet the RI/FS objectives.

1.2 Scope of Investigation

The Phase I Site Characterization included a variety of tasks completed during a 3-year period. The major elements of the scope of work included:

- Install two bedrock borings beneath the Landfill to depths between 410 and 420 feet below ground surface (bgs).
- Perform geophysical logging of the boreholes to characterize bedrock stratigraphy and to identify fractures, voids, or other zones of potential water yield.
- Collect discrete groundwater samples to identify specific depths where COPCs may be present and to characterize variability in COPC concentrations with depth.
- Install two groundwater monitoring wells (one shallow and one deep) within each of the bedrock borings for permanent groundwater monitoring.
- Conduct quarterly sampling of the new wells and a specified set of existing groundwater monitoring wells for 1 year.
- Sample and gauge seeps and springs under varying seasonal conditions.
- Sample and gauge streamflow in Winsel Creek, a stream located east of the Landfill.

Section 3 of this report describes the implementation of these tasks.

2. Investigation Background

2.1 Landfill History

The Landfill (**Figure 2-1**) operated as a municipal and industrial waste disposal facility from 1970 to 1975. Both industrial and municipal wastes were accepted in the ravine portion of the Landfill. The Landfill was permitted by the Missouri Department of Natural Resources (MDNR) in 1974. In 1975, operations in the ravine portion of the Landfill were being phased out. Trench cells were constructed on the north end of the Landfill. In 1978, the MDNR issued a permit for an 8.5-acre area for trench-type disposal. In 1982, an additional 0.5-acre trench area was permitted by the MDNR. During trench construction, an industrial waste cell was constructed to store approximately 200 drums. The Landfill ceased accepting waste in 1983.

Six groundwater monitoring wells were installed at the Landfill in 1992. In May 1992, approximately 149 drums (55-gallon capacity) and 32 buckets (5-gallon capacity) deposited in the industrial waste cell were removed by Laidlaw Environmental Services, Inc. under the supervision of ABB-Environmental Services (ABB-ES). None of the drums were found to have leaked. ABB-ES submitted a Closure Plan Report to the MDNR in 1993 (ABB-ES, 1994). Construction of a landfill cap and associated leachate collection system began in 1994 and was completed in 1995 (ABB-ES 1996); the MDNR approved closure of the Landfill in 1996. The Landfill is currently part of a 30-year post-closure care program that involves biennial sampling of groundwater monitoring wells and landfill cap inspections.

2.2 Site Investigation Area

The study area of the Phase I Site Characterization (i.e., the SI Area) includes the Landfill and a region of public and private land considered to be potentially downgradient from the Landfill, an area extending from the Landfill east as far as the Meramec River (Figures 1-1 and 2-1). The major features of the SI Area and its vicinity include:

- The Landfill, which is a capped, grass-covered, 28-acre landfill located on top of a hill and is accessible from Emma Lane. The Landfill is fenced and is kept locked.
- The area immediately surrounding the Landfill, which includes farmland (to the north), the City of Sullivan's wastewater treatment plant (approximately 700 feet to the northeast), a small slaughterhouse (immediately to the east), and generally open or wooded land. Some private residences are located west of the Landfill on

**Phase I Preliminary
Site Characterization
Summary Report**

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

Emma Lane, and a trailer park is located approximately 1,500 feet north of the Landfill, beyond a farm field.

- Winsel Creek, an intermittent stream that flows in a counterclockwise arc beyond the east side of the landfill. The creek passes as close as approximately 300 feet from the landfill (to the southeast), where it is approximately 60 feet lower in elevation than the landfill crest. The creek continues to descend downstream to the north and west.
- Meramec State Park, encompassing most of the SI Area east of Winsel Creek. The parkland is mostly rugged, undeveloped forest, with steep terrain descending more than 250 feet in elevation eastward to the Meramec River. The river valley is deeply dissected by several west-to-east trending tributary valleys; Copper Hollow is the largest.
- Several caves and large springs, most located in the tributary valleys adjoining the Meramec River. The two most notable caves include the privately owned La Jolla Spring Cave Complex and Fisher Cave located within Meramec State Park.

The Landfill lies outside and to the northeast of Oak Grove Village, a small semirural community, which is adjacent to and generally northeast of the larger city of Sullivan. The Oak Grove Village municipal water wells (OGV Well #1 and #2) are located approximately 1 mile to the southwest of the Landfill.

2.3 Topography and Drainage

The terrain in the SI Area is divided between a high, gently rolling upland in the west, and a rugged, deeply dissected valley to the east (Figure 2-2). The division between these two regions is a low ridge that forms a surface-water divide between two major surface watersheds:

- The plateau in the western part of the SI Area drains northward to the Bourbeuse River, approximately 10 miles distant. Winsel Creek, a tributary to the Bourbeuse River, captures surface runoff near the Landfill, from Oak Grove Village and much of Sullivan.
- The steep-sided valleys in the eastern part of the SI Area drain eastward to the Meramec River.

It is important to note that in the SI Area, the boundaries of surface drainage basins do not correlate with groundwater drainage basins. The SI area lies in a region of Missouri that is subject to karst, the process of preferential dissolution of rock by circulating groundwater. Karst forms where groundwater progressively enlarges the existing flow paths (such as bedrock fractures), increasing the aquifer transmissivity and altering its drainage patterns by creating networks of interconnected conduits. The caves and springs found near the Meramec River are the clearest evidence of karst in the SI Area.

The high transmissivity of many karst aquifers means they can be extremely effective at transmitting water to base-level streams, often limiting the hydraulic need for higher-order surface streams such as Winsel Creek. As discussed in Section 4.3.1, the bed of Winsel Creek is more than 100 feet above the groundwater levels in the bedrock aquifer beneath it, making the stream (when flowing) both perched and losing.

Given the complex relationship of groundwater and surface water in the SI Area, water falling on the ground near the Landfill may take several different pathways. Surface water originating from the Landfill will flow to Winsel Creek, and eventually to the Bourbeuse River, if it does not infiltrate first. Water infiltrated directly, or carried in Winsel Creek but then lost from infiltration or swallows will flow as groundwater toward the Meramec River and most likely discharge at springs. In the SI Area, all groundwater is interpreted to flow to the Meramec River, the local base level.

2.4 Geologic Context

The SI Area is located in a region of the Ozark Plateau underlain by an estimated 1,000 to 1,500 feet of gently dipping sedimentary rock, dating to the Cambrian and Ordovician Periods. These strata consist chiefly of dolomite, with lesser amounts of sandstone and minor shale. The geologic setting is described in numerous previous studies (Imes and Emmett [1994], Robertson [1991], Van Dike [1996], Thompson [1991]), and from previous site-specific reports (e.g., MDNR 2007). A generalized stratigraphic column is shown on Figure 2-3. The occurrence of these strata in the SI Area is shown in map view and cross section on Figure 2-4. The principal units of interest to this investigation include (from the shallowest to deepest):

- Roubidoux Formation (Ordovician), consisting of sandstone, sandy dolomite, dolomite, chert, sandy chert, and cherty dolomite. The Roubidoux is typically the shallowest bedrock unit present throughout the upland plateau underlying Sullivan and Oak Grove Village. The unit is eroded and absent in the Meramec River valley.

- Gasconade Dolomite (Ordovician), consisting of medium to coarsely crystalline dolomite, finely crystalline dolomite, and cherty dolomite (Thompson 1991). Informally, the Gasconade Dolomite is separated into an "upper" interval that is relatively chert-free and may contain sandstone stringers, and a "lower" interval that may contain more than 50 percent chert. The Gasconade Dolomite sporadically includes a sandstone member, the Gunter Sandstone, at the base of the unit. The Gunter Sandstone occurs as a medium-grained quartzose sandstone, where present. The Gasconade Dolomite is present at its full thickness (approximately 210 feet) beneath the upland plateau, but is deeply eroded in the Meramec River valley, present only in the high bluffs but absent in the valley bottoms.
- Eminence Dolomite (Cambrian), consisting of light gray, medium to coarsely crystalline cherty dolomite with some light-colored shale partings. Bedding in the Eminence Dolomite is generally medium to massive. A major diagnostic feature of the Eminence Dolomite is the chert content, which occurs as seams, ledges, and irregular masses (Thompson 1991). The Eminence Dolomite is present throughout the entire SI Area, exposed only in the valley bottoms in the Meramec River valley.
- Potosi Dolomite (Cambrian), consisting of brown to gray, fine to medium crystalline, massive, poorly bedded dolomite with zones of quartz druse (Hayes and Knight 1961) and chertified algal forms, possibly stromatolites. Banded quartz druse is a prominent diagnostic feature of the Potosi Formation (Grohskopf and McCracken 1949). The Potosi is intact beneath the entire SI Area, with no surface exposures.

The base of the Potosi Dolomite is estimated to be approximately 800 feet bgs near the Landfill (Smith et al. 2004). Deeper sedimentary bedrock, comprising primarily dolomite, shale, and sandstone, continue below the Potosi Dolomite down to the Precambrian basement at estimated depths of 1,000 to 1,500 feet bgs.

The dominant structural trend in this region of Missouri is a gentle north to northeastward bedding dip, descending away from the St. Francois Mountains farther to the south. In the Sullivan area, the regional trend is complicated by the presence of an isolated volcanic knob that rises more than 1,200 feet from the Precambrian basement and is exposed at grade to the west of Sullivan. The younger Paleozoic sedimentary rocks were deposited upon this knob (rather than intruded by it); thus, younger bedrock is not significantly deformed. However, bedrock in the Sullivan area contains several minor normal faults that create vertical offsets in the stratigraphic

section. One such fault is shown in the plan-view inset on Figure 2-4, but was not interpreted to extend as far north as the Landfill.

Site-specific observations relating to the geology of the SI Area are presented in Section 5.

2.5 Regional Hydrogeologic Setting

The SI Area and surrounding region overlies two bedrock aquifer systems separated by a confining unit (Imes and Emmett 1994). From shallowest to deepest, these hydrostratigraphic units include:

- The Ozark Aquifer (approximately 800 feet thick in the SI Area), including the Roubidoux Formation, Gasconade Dolomite, Eminence Dolomite, and Potosi Dolomite.
- The St. Francois confining unit (180 to 330 feet thick) consists of the Derby-Doerun Dolomite and the Davis Formation.
- The St. Francois Aquifer (350 to 650 feet thick) comprises the Bonneterre Formation and the Lamotte Sandstone.

Of these hydrostratigraphic units, the Ozark Aquifer is the chief concern within the SI Area, comprising as much as 800 feet of the uppermost bedrock. The underlying St. Francois confining unit provides some hydraulic separation between the Ozark and the St. Francois Aquifers.

The Ozark Aquifer is characterized as a karst aquifer (Imes and Emmett 1994) in which the dominant groundwater pathways follow integrated networks of fractures and other void spaces that have been enlarged by the progressive dissolution of the dolomite bedrock. The dominance of conduit networks and the high transmissivity of karst aquifers distinguish them from non-karst aquifers in several ways:

- Extreme heterogeneity of flow, with the majority of flow occurring within the conduit system instead of being evenly distributed throughout the aquifer mass.
- Tortuous flow paths (in the vertical and horizontal dimensions) governed by hydraulic gradients and the geometry of conduit networks.

**Phase I Preliminary
Site Characterization
Summary Report**

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

- Abnormally deep water tables, often below the elevation of high-order surface streams (such as Winsel Creek, in the SI Area).
- Groundwater drainage basins formed around networks of interconnected conduit that may bear no resemblance to surface drainage patterns.

Evidence of karst in the SI Area is abundant, including sinkholes and a losing stream in the upland area, caves and springs in the Meramec River valley, and significant voids reported in wells from the Site and throughout the Oak Grove/Sullivan area.

Site-specific observations relating to the hydrogeology and groundwater flow are presented in Section 5.

**Preliminary Phase 1
Site Characterization
Summary Report**

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

3. Previous Environmental Investigations

This section discusses previous environmental investigations performed at OU2, according to the Settlement Agreement and AOC (USEPA 2009). TRW is on record as not agreeing with all the conclusions provided in the reports summarized below.

3.1 Hydrochemical Investigation – 1990

In August 1990, the City of Sullivan entered into a hydrochemical investigation with the U.S. Geological Survey (USGS) as a result of leachate samples collected from the landfill, as well as groundwater samples collected from several area wells, including the Oak Grove Village municipal well #1, a former City of Sullivan municipal well, and the Landfill monitoring wells.

During the hydrochemical investigation, the USGS sampled three of the largest seeps from the landfill for volatile organic compounds (VOCs) and metals. Results indicated the presence of tetrachloroethene (PCE) at concentrations ranging from 8 to 19 micrograms per liter (µg/L) and trichloroethene (TCE) at concentrations ranging from 150 to 370 µg/L. TCE degradation products, Freons, and other COPCs were also detected.

In September 1990, the MDNR issued a citation to the City of Sullivan based upon available sampling results and the annual solid waste disposal facility inspections. In response to the MDNR citation, the City of Sullivan constructed berms around the cited seeps to help prevent off-site migration of leachate.

In October 1990, the City of Sullivan issued a Notice of Liability letter to the Ramsey Corporation (owned by TRW) and Meramec Industries as primary contributors of hazardous waste to the Landfill.

After the City of Sullivan's Notice of Liability letters were mailed, a potentially responsible party (PRP) group was formed to address contamination from the Landfill. This group comprised TRW, the City of Sullivan, and the Meramec Group.

3.2 Sullivan Area Tracer Tests

In 1991 and 1994, the MDNR's Division of Geology and Land Survey performed five dye tracer tests in the Sullivan area. One of these tracers was injected into a sinkhole at the closed Landfill. The tracer was identified in La Jolla Spring 179 days after the

tracer was released into the sinkhole. The conclusions of the tracer tests were disputed by TRW (TRW 2005) and Ewers (Ewers 1994). Ewers suggested that, based on the conservative quantities of dye and sensitive analytical techniques used for the test, it would be difficult to conclude that tracer put in the sinkhole at the Landfill is the same as that detected in La Jolla Springs.

3.3 Landfill Drum Removal – 1992

In May 1992, prior to landfill closure, the PRP Group removed approximately 149 drums (55-gallon capacity) and 32 buckets (5-gallon capacity) that had been deposited in the industrial waste cell. The PRP Group installed six monitoring wells at the Landfill to determine if contaminants were migrating from the SI Area. The shallowest monitoring well (MW-105) was drilled to 177 feet bgs; the deepest monitoring well (MW-102A) was drilled to an approximate depth of 275 feet bgs.

3.4 Groundwater Sampling

Several COPCs, including TCE and Freon 11, have been detected in all six of the Landfill monitoring wells (MW-101, MW-102A, MW-102B, MW-103, MW-104, and MW-105) since their installation in 1992. TCE concentrations have been detected at concentrations ranging from 0.5 to 6.6 µg/L, and Freon 11 has been detected at concentrations ranging from 1.4 to 197 µg/L.

The Voss well (354 feet deep), a private well located adjacent to the Landfill, has had TCE detections during sampling events since 2000 at levels ranging from 1.6 to 5.4 µg/L, and Freon 11 at levels ranging from 15 to 120 µg/L.

3.5 Missouri Department of Natural Resources Remedial Investigations

In 2005, the MDNR drilled three deep monitoring wells as part of the Phase II remedial investigation (RI) for the Oak Grove Village Well Superfund Site. One of these wells was located 250 feet south of the Landfill. The well was drilled 501 feet bgs, for a total depth of 505 feet. As part of the Post-Phase II investigation, the borehole at the Landfill was completed as a dual-elevation well. The open annulus of the well (from 104 to 280 feet bgs) is referred to as MW-1A and the deeper open-hole section (below the riser from 349 to 505 feet bgs) is referred to as MW-1.

In April 2006, the MDNR collected samples from MW-1A and MW-1. Both field analysis and laboratory results showed small concentrations of TCE and other COPCs in

MW-1A. No concentrations above the laboratory reporting limits were detected in the deeper MW-1.

During Phases I and II of the RI, the MDNR conducted periodic sampling of private wells located near the Landfill. Several COPCs, including TCE and Freon 11, were detected in private wells located west of the closed Landfill. Two of these private wells had TCE detections above the maximum contaminant level (MCL) of 5 µg/L and were provided whole-house filtration systems by the USEPA in 2003.

In 2005, TRW provided comments to the MDNR on the Phase II RI/FS and the Proposed Plan for the Oak Grove Village Well Site (TRW 2005). Additionally, in 2007, TRW provided comments to the MDNR on the Post-Phase II RI/FS and the Proposed Plan for Interim Action at the Oak Grove Village Well Site, Operable Unit 1 (TRW 2007). These comments highlighted data gaps that prevented the delineation of the nature and extent of COPCs near the Landfill, and suggested that the conclusion that the Landfill is a source of COPCs to groundwater cannot be conclusively determined with the available data.

3.6 La Jolla Spring Cave Complex Sampling

From October 2002 to January 2005, the USEPA and the MDNR conducted six sampling events (air and water) in the La Jolla Spring Cave Complex. Sample results detected the presence of Freon 12; Freon 11; 1,1-dichloroethene (1,1-DCE); methylene chloride; cis-1,2-dichloroethene; TCE; toluene; m,p-xylene; 1,4-dichlorobenzene; PCE; ethanol; 2-propanol; and acetone. In the cave air, Freon 11 was detected at concentrations as high as 270 micrograms per cubic meter (µg/m³) and TCE was detected as high as 1,700 µg/m³. Water samples within the La Jolla Spring Cave Complex detected Freon 11 at concentrations as high as 2.13 µg/L and TCE at concentrations as high as 12.6 µg/L. For comparison, analytical results from sampling performed in the La Jolla Spring Cave Complex in 2010 indicated TCE concentrations ranging from not detected to 5.1 µg/L.

3.7 MDNR Landfill Sampling – 2005

In 2005, the MDNR conducted a multimedia investigation of the Landfill, consisting of gas sampling of the passive landfill vents, geophysical logging using a membrane interface probe, and collection of discrete soil, leachate, and subsurface gas samples using direct-push methods (MDNR 2006). The MDNR concluded that the Landfill does produce methane when sufficient moisture is present to support methanogenesis.

**Preliminary Phase 1
Site Characterization
Summary Report**

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

Additionally, the sampling performed by the MDNR indicated the presence of VOCs (including TCE, vinyl chloride, cis-1,2-DCE, PCE, and methylene chloride) and Freon compounds (including CFC-11 [Freon 11], CFC-12 [Freon 12], CFC-113 [Freon 113], and CFC-114 [Freon 114]) in the Landfill leachate.

4. Site Investigation

4.1 Overview

The Phase 1 Site Characterization was composed of tasks designed to simultaneously:

- Evaluate whether the Landfill was a source of COPCs to groundwater.
- Sample surface water and springs in areas where, if an impact from the Landfill existed, COPCs could plausibly be transported via groundwater.

Note that the spring and surface-water sampling points included in the investigation are not uniquely associated with the Landfill. The catchment of each sample point is assumed to be significantly larger than the Landfill and to potentially encompass other, unrelated sources of COPCs.

4.2 Site Investigation Area Reconnaissance

Prior to the scheduled start of drilling and sampling activities on April 6, 7, and 8, 2010, representatives of ARCADIS, the USEPA, the USGS, and the MNDR completed a reconnaissance of the SI Area. The reconnaissance was completed to locate proposed drilling and sampling locations, identify potential accessibility issues, and reach agreement on selected sampling locations. The areas visited include:

- *Landfill.* The proposed drilling locations for new wells MW-107 and MW-108 were located and staked (Figure 4-1).
- *Winsel Creek.* The reconnaissance team evaluated an approximately 1-mile-long reach of Winsel Creek, starting southwest of the Landfill and extending downstream, northeast of the wastewater treatment plant settling ponds. No springs or seeps were identified in this reach. Four stream locations suitable for sampling and gauging were identified (Figure 4-2). The area between the Landfill and Winsel Creek was also reconnoitered for possible seeps; however, none were found.
- *Copper Hollow.* The reconnaissance team hiked to Copper Hollow (an area accessible only by footpaths in Meramec State Park) to locate springs for sampling. Tin Cup Spring and Copper Hollow Spring were located. No other significant springs were identified along Copper Hollow. Cane Hollow, a small

valley immediately south of Copper Hollow, was also explored; however, no additional springs were identified.

- *La Jolla Spring/Meramec Cavern.* The reconnaissance team was granted access to Meramec Caverns and was escorted by cavern personnel through the developed portions of the cave. Two sampling and gauging locations were identified located on the primary cave stream (SW-LJ-01 and SW-LJ-03), and a third located a small tributary stream entering from the north (SWLJ-02). Locations are shown on Figure 4-3.
- *Fisher Cave.* The reconnaissance team was granted access to Fisher Cave and was escorted into the cave by a Missouri state park ranger. Three sampling and gauging locations were identified (Figure 4-4). Two upstream locations (SW-FC-02 and SW-FC-03) were located on the two primary tributaries streams that join inside Fisher Cave. A third sample location (SW-FC-01) was located farther downstream in the primary cave stream, just inside the cave entrance.

The sampling points were sketched in a field log and, except for cave sample points, were located using a handheld global positioning system. Water quality data including temperature, pH, and specific conductance were collected with field instrumentation, following the procedures described in the Field Sampling Plan (FSP; included as Attachment 3 to the RI/FS Work Plan [ARCADIS, 2010]).

4.3 Surface-Water and Spring Characterization

Sampling was performed on Winsel Creek and in selected springs and cave streams within the SI Area to assess the presence of COPCs at these locations (Figure 4-2). This task consisted of two sampling events:

- *May 25, 26, and 27, 2010.* Sampling and gauging of Winsel Creek, and targeted SI Area springs and cave streams. This sampling event was scheduled to occur during wet season conditions.
- *October 13 and 14, 2010.* Sampling and gauging of targeted SI Area springs and cave streams. This sampling event was scheduled to occur during dry season conditions and did not (as planned) include a repeat sampling event in Winsel Creek. The creek was dry at the time of the sampling event.

Sections 4.3.1 and 4.3.2 describe the scope and methodology of the sampling that was conducted.

4.3.1 Winsel Creek Sampling and Gauging

Winsel Creek is an intermittent stream located south, east, and north of the Landfill, as shown on Figure 4-2. The stream bed of Winsel Creek is at a lower elevation than the Landfill; therefore, the potential exists for surface-water runoff from the Landfill to reach the creek. During the site reconnaissance, ARCADIS identified four sampling locations in Winsel Creek:

- SW-WC-01, selected at a location downstream of the Sullivan Treatment Plant outfall. This sampling location was chosen to be sufficiently downstream of the outfall that effluent and stream flow would be well-mixed.
- SW-WC-02 and SW-WC-03, selected as representative locations between the landfill and the creek.
- SW-WC-04, selected at a location upstream of the landfill.

Leachate seeps, observed historically on the periphery of the Landfill, are also considered to be potential exposure pathways. During the Site reconnaissance, the area between the Landfill and Winsel Creek was reconnoitered for possible seeps; however, none were found. If ARCADIS had identified seeps, they would have been incorporated in the sampling program. Note that seeps were not observed by field personnel at any point during the Phase 1 field program despite periods of prolonged wet weather. The current absence of seeps is consistent with a significant long-term decline in leachate production observed in the Landfills leachate collection system since its implementation (based on conversations with Sullivan Public Work Department staff).

In accordance with the work plan (ARCADIS 2010), the sample points identified on Winsel Creek were sampled once for the full list of COPCs, as presented in Table 4-1. The sampling event occurred on May 25, 2010, concurrent with the first round of spring and La Jolla Spring Cave Complex sampling.

Grab samples were collected at each point, following one of the recommended surface-water sampling procedures contained in the FSP. Samples were pumped directly to the sample containers using a portable peristaltic pump with dedicated

tubing. The tubing inlet was placed beneath the water surface in the center of the flowing section of the creek at each sample location. Field parameters of temperature, conductivity, and pH were recorded using a field meter deployed directly into the stream.

At each of the four sampling locations, the flow in Winsel Creek was gauged using the velocity-area method, using a flowmeter to measure the average current velocity at regular intervals across a perpendicular transect of the stream. The meter used, a Marsh-McBirney Flo-Mate Model 2000 portable electromagnetic flowmeter, was approved by USGS field personnel. Because stream depths were in all cases less than 1 foot, the standard assumption was that velocity measured at 0.6 times the measured depth approximated the average velocity in the vertical profile.

At each sampling location, USGS representatives acting on behalf of the USEPA collected duplicate analytical samples, and performed independent flow gauging.

4.3.2 Spring and Cave Stream Sampling and Gauging

The SI Area reconnaissance, described above, identified eight spring and cave stream sampling locations between the Landfill and Meramec River based on accessibility and geographic distribution. The locations included two springs, three cave stream locations inside the La Jolla Spring Cave Complex, and three cave stream locations inside Fisher Cave. Each location is shown on Figure 4-2. The approach to sampling and gauging each is described below.

4.3.2.1 Spring Sample Locations

- SW-CH1 (Copper Hollow Spring), a large spring emerging from a bedrock bluff near the entrance to Copper Hollow Spring Cave on the south flank of Copper Hollow, approximately 1,700 feet upstream of its junction with the Meramec River. The spring emerges as a well-formed, 5- to 6-foot-wide channel that could be gauged by the velocity-area method using a standard flow meter.
- SW-TC1 (Tin Cup Spring), a small spring discharging from a bedrock orifice in the south bank of Copper Hollow Creek approximately 2,200 feet upstream of Copper Hollow Spring. The spring emerges less than 1 foot above the primary stream channel and cascades down a poorly formed rock and gravel chute. To measure flow, a flexible container was used to capture the flow for a timed period (a rubber

hip wader was the most effective container available). The water was then transferred to a graduated bucket to quantify the volume of discharge.

4.3.2.2 La Jolla Spring Cave Complex Sampling Locations (Figure 4-3)

- SW-LJ01, located inside the La Jolla Spring Cave Complex on the primary cave stream, approximately 900 feet from the main cave entrance. The location is at the most downstream footbridge crossing the cave stream in the developed portion of the cave. At this location, the stream is approximately 16 feet wide and averages approximately 2.2 feet deep. The footbridge provides a safe transect location for collecting samples and gauging flow without wading into the cave stream. Flow was measured by the velocity-area method using a flowmeter lowered over the upstream railing of the footbridge.
- SW-LJ02, located inside the La Jolla Springs Cave Complex approximately 1,100 feet from the main cave entrance. The location is on a minor tributary to the main cave stream that enters from the north, down a section of the cave known as the Atomic Shelter Passage. During the May 2010 event, flow in the tributary was insufficient to gauge reliably; however, samples could be collected. During the October 2010 event, the tributary was dry and samples could not be collected.
- SW-LJ03, located inside the La Jolla Springs Cave Complex on the primary cave stream approximately 1,700 feet from the main cave entrance. The location is at the upstream terminus of the developed section of the cave. Due to safety concerns, it was agreed with the USEPA and the USGS that samples would be collected at SW-LJ03, but that no flow measurement was required. (Note that the USGS completed flow measurements at both SW-LJ01 and SW-LJ03 during each sampling event.)

4.3.2.3 Fisher Cave Sampling Locations (Figure 4-4)

- SW-FC01, located in Fisher Cave's primary cave stream immediately inside the cave entrance. The cave stream forms from two principal tributaries (sampled individually at SW-FC02 and SW-FC03) that combine inside the accessible portion of the cave and flow out the mouth of the cave onto the floodplain adjacent to the Meramec River. Flow gauging was completed by velocity-area method using a flow meter.

- SW-FC-02, located on the southern tributary to the primary cave stream in Fisher Cave. The location is approximately 1,500 feet from the cave entrance on a section of the cave known as the Weeping Willow Passage. Flow gauging was completed by velocity-area method using a flow meter.
- SW-FC-03, located on the northern tributary to the primary cave stream in Fisher Cave. The location is approximately 1,400 feet from the cave entrance on a section of the cave known as the Grand Canyon. Flow gauging was completed by velocity-area method using a flow meter.

At each location, samples were collected using a peristaltic pump with the tubing inlet deployed in midstream and at the center of the water column. For springs, the intake was placed as near to the spring orifice as feasible. Where the centerline of the stream could not be easily reached from shore (as in the La Jolla Cave Complex samples), the tubing was affixed to a pole and extended to the target depth and position. Water samples collected from the La Jolla Spring Cave Complex were analyzed for the same list of COPCs required for groundwater monitoring, as presented in Table 4-2. Samples collected from the other springs and cave stream locations were analyzed for TCL VOCs only. Field parameters of temperature, conductivity, and pH were recorded using a field meter deployed directly into the stream.

4.4 Groundwater Characterization

The groundwater characterization tasks for the Phase 1 Site Characterization were focused on the Landfill. In general, the tasks comprised:

- Drilling and testing two deep bedrock boreholes
- Installing and developing a pair of nested monitoring wells in each borehole
- Collecting four quarters of groundwater samples from the new and existing Landfill monitoring wells

The scope and methodology for these tasks are discussed below.

4.4.1 Boring Locations and Site Preparation

The two proposed drilling locations were identified and marked during the preliminary reconnaissance on April 6, 7, and 8, 2010 (Figure 4-1). These locations were identified

by the USEPA as the areas of the landfill that would comprise the highest potential for detecting elevated concentrations of VOCs in groundwater beneath the Landfill, based on known hydrologic conditions (a sinkhole) and past visual observations (observed seeps). The two locations are described below:

- MW-107, located in the northwest corner of the Landfill. This location was recommended by the USEPA based on its proximity to a former seep, previously observed on the northwestern edge of the Landfill. (Note that the seep was not observed to be active at any point during the Site Characterization field program.) The location is also on the edge of the landfill most proximal to a trailer park where VOCs have been detected in groundwater.
- MW-108, located in the approximate center of the Landfill near a sinkhole that has been noted historically.

The selected locations were on open, generally flat ground on crest of the landfill, accessible by traversing the grass-covered landfill cap. A gravel ramp was constructed at the entrance to the landfill to permit rig and support truck access. Under dry conditions, the landfill was judged to adequately support the drilling rigs and support vehicles. Under persistently wet or thawing conditions, it was necessary to restrict vehicle movement to limit damage to the landfill cap.

Before drilling began, ARCADIS completed the following utility avoidance measures:

- Contacted the Missouri One-Call System.
- Obtained and reviewed site plans, including landfill utilities and municipal sewer lines.
- Consulted a knowledgeable person representing the City of Sullivan to verify that no utilities were present near the drilling locations.

4.4.2 Borehole Drilling and Testing

On October 14, 2010, drilling commenced for the boreholes for new monitoring wells MW-107 and MW-108 and continued with several interruptions until reaching the final depths of the boreholes on September 1, 2011. As specified in the FSP, drilling consisted of a series of steps, including varied drilling methods, collection of samples for screening level analysis, and geophysical logging. Due to the step-wise drilling plan,

Preliminary Phase 1 Site Characterization Summary Report

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

the two boreholes were advanced concurrently rather than in series. Where appropriate, the drill rig moved back and forth between the two locations to expedite the drilling process. The drilling and testing processes are described below.

4.4.2.1 Overburden Drilling

The initial stage of drilling advanced each borehole through the landfill materials using an auger rig. At each borehole, the landfill waste consisted primarily of mixed municipal trash with some concrete rubble. As specified in the FSP, no split-spoon samples were collected and field identification was based on auger cuttings. Air monitoring was completed using a photo ionization detector and 4-gas meter.

The base of landfill materials at each boring was found at approximately 16 feet bgs, where the top of the weathered Roubidoux Formation sandstone was encountered. Because of difficulties with hole stability, temporary 24- and 20-inch conductor casing were used to keep the borehole from caving until the next stage of drilling was completed.

Boreholes were checked periodically for potential leachate. No liquid was observed.

4.4.2.2 Installation of Surface Casing

With the landfill materials supported by temporary conductor casing, drilling continued using a cable-tool rig. At each borehole, a 19.5-inch-diameter cable-tool bit was advanced approximately 10 feet into the bedrock surface. The cable-tool drilling method required introduction of potable water as a drilling fluid. Screening-level samples to detect the potential presence of COPCs were collected as direct grab samples of drilling slurry (the mixture of drilling water and cuttings). The samples indicated in the table below were submitted for analysis of VOCs. USGS representatives collected split samples.

Boring Location	Sample Depth (feet bgs)	Sample Date	Sample Type
MW-107	16	4/26/2011	Grab sample of drilling slurry
MW-108	26	11/12/2010	Grab sample of drilling slurry

Drilling continued to a depth of 27 feet bgs at MW-107 and 26 feet bgs at MW-108. Sixteen-inch steel casing was installed and grouted in place in each borehole using the methods described in the FSP.

4.4.2.3 Vadose Zone Rock Drilling

As specified in the FSP, each borehole was advanced through the upper section of rock and permanently cased off to approximately the same elevation as the casing in existing well MW-1 (i.e., 755 feet above mean sea level [amsl]). This measure was taken to isolate the vadose portion of bedrock, maintaining hole stability for deeper drilling and limiting potential downhole leachate migration, if encountered.

Drilling in the vadose rock zone was performed with a cable tool with a 14-inch-diameter bit, using potable water as a drilling fluid. Grab samples of drilling slurry were collected for VOC analysis from the depths indicated in the table below.

Boring Location	Sample Depth (feet bgs)	Sample Date	Sample Type
MW-107	97	5/16/2011	Grab sample of drilling slurry
MW-107	185	6/17/2011	Grab sample of drilling slurry
MW-108	80	11/19/2010	Grab sample of drilling slurry
MW-108	141	12/1/2010	Grab sample of drilling slurry
MW-108	185	12/15/2010	Grab sample of drilling slurry

Based on the land-surface elevation at the boreholes, and the historical range of water-levels in the shallow wells at the Landfill, a target depth of 185 feet bgs was selected for installation of the 10-inch-diameter steel inner surface casings. This depth was judged to be near, but slightly above the average seasonal maximum water table. Drilling through the vadose zone progressed slowly at each borehole due to the presence of clay-filled and partially open solution cavities. No perched groundwater or leachate was present in any of the voids encountered within this interval of drilling.

Drilling continued to a depth of 186 feet bgs at both boreholes. Ten-inch steel casing was installed and grouted in place in each borehole. Due to the presence of solution cavities, the FSP-prescribed method of pressure-grouting could not be completed. As planned, grout introduced through the bottom of the casing would have diverted into the cavities rather than fill the borehole annulus. Instead, casings were grouted in incremental lifts using a tremie pipe outside of the casing. The USEPA was notified of this change by electronic mail (December 21, 2010, J. Shonfelt to T. Howell).

Preliminary Phase 1 Site Characterization Summary Report

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

4.4.2.4 Drilling through Saturated Bedrock

The final drilling stage was planned to advance each borehole so that it penetrated a transmissive zone observed in the upper Eminence Dolomite at existing well MW-1. The AOC stipulated a target termination elevation of 525 feet amsl, amounting to a depth of at least 395 feet bgs. The FSP specified advancing this stage of each boring by 10-inch-diameter air-rotary drilling. However, at both wells the first 50 feet of this interval (i.e., 185 to 235 feet bgs) was drilled using cable-tool methods, before transitioning to air-rotary methods for drilling to the final target depth. The cable-tool rig was used for the shallower section of each borehole due to soft landfill conditions, which prohibited making the required switch of drill rigs when, in both instances, drilling was ready to proceed. Air-rotary drilling was used to complete each borehole below 235 feet bgs after the landfill had dried sufficiently to mobilize the air-rotary rig without damaging the cap.

As specified in the FSP, screening-level borehole groundwater samples were collected for analysis of TCL VOCs at several depths as drilling progressed. The table below summarizes the samples collected.

Boring Location	Intake Depth (feet bgs)	Open Interval (feet bgs)	Sample Date	Sample Type
MW-107	220	186-235	7/11/2011	Purged 643 gallons and collected samples
MW-107	280	186-295	8/17/2011	Purged 1,212 gallons and collected samples
MW-107	340	186-355	8/22/2011	Purged 1,800 gallons and collected samples
MW-108	195	186-195	1/5/11	Direct grab in open borehole
MW-108	210	186-210	1/6/11	Direct grab in open borehole
MW-108	220	186-235	3/16/2011	Purged 458 gallons and collected samples
MW-108	262	186-295	8/29/2011	Purged 1,288 gallons and collected samples
MW-108	313	186-355	8/31/2011	Purged 1,875 gallons and collected samples

The FSP prescribed the use of inflatable packers to isolate each sample interval before collection. However, significant difficulties with borehole cave-in from several large voids made the use of packers too risky to attempt (e.g., if cave-in occurred while

packers were deployed, the packer string could be permanently stuck, leaving no way of completing the borehole).

Therefore, the samples were collected without packers from open borehole intervals that increased in length with each successive stage of drilling. To maximize the likelihood that each sample was representative of its intended test interval, the pump used for the purged sample was placed approximately 15 feet from the bottom of the open borehole for each test. Each interval was purged of a total of 3 volumes of the full length of the open borehole prior to sampling. The USEPA agreed to this alternative sampling approach after reviewing the analytical data from open borehole samples collected during drilling (ARCADIS 2011a and 2011b).

The deepest interval of each borehole (approximately 355 to 410 feet) was not tested using the open-hole 3-volume purge method. Because the FSP required installation of a permanent well in this zone (which includes the target transmissive zone), collecting a preliminary screening-level sample was agreed to be unnecessary.

The borehole of MW-107 reached its total drilled depth of 410 feet bgs on August 23, 2011. The borehole of MW-108 was terminated at 420 feet bgs on September 1, 2011.

4.4.3 Geophysical Logging

After completion of drilling, geophysical logging was completed for each borehole on September 27, 28, and 29, and October 6, 2011. The logging suite included the following:

- Downhole video camera survey with side-looking capability
- Borehole fluid temperature and fluid resistivity log
- Natural gamma log
- Three-arm caliper log
- Heat pulse flow meter log

The downhole camera survey was recorded for each well on the first day of logging, with separate sweeps for side- and down-view camera angles. Logs of fluid temperature and resistivity were recorded the following day after allowing the boreholes to stand undisturbed overnight. Natural gamma and caliper logs were then completed.

Preliminary Phase 1 Site Characterization Summary Report

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

Vertical flow meter logging was completed using a heat-pulse flow meter, taking ambient flow readings at approximately 15 to 20 stations in each borehole. In an initial pass, the flow meter was fitted with rubber baffles sized to the 10-inch borehole diameter. In MW-107, ambient vertical flow was measurable with this setup at all targeted depths. At MW-108, vertical flow rates measured shallower than approximately 350 feet bgs exceeded the operational range of the flow meter, and could be detected only by repeating the measurements with an undersized baffle that allowed some flow to bypass the meter. Values recorded while using an undersized baffle are semiquantitative, but were judged by the field team (which included the USGS) to be satisfactory for indicating flow direction and relative flow rate. Based on the degree of ambient flow measured in each borehole, it was agreed that dynamic flow logging (i.e., flow logging while pumping from the top of the water column) was unlikely to provide significant additional information, and was not attempted.

Geophysical data are presented on logs in Appendix A.

4.4.4 Open Borehole Point Sampling

On October 5, 2011, after reviewing the geophysical logging data, six open-hole point samples were collected as a final step to evaluate the vertical distribution of COPCs before selection of well-screen intervals. Target sample depths were selected above, within, and below the apparent transmissive zone (a zone identified via the geophysical logging at depths of approximately 350 to 380 feet bgs in both boreholes). The table below summarizes the samples collected.

Boring Location	Intake Depth (feet bgs)	Open Interval (feet bgs)	Sample Date	Sample Type
MW-107	340	186-410	10/5/2011	Point-sampler direct grab
MW-107	360	186-410	10/5/2011	Point-sampler direct grab
MW-107	390	186-410	10/5/2011	Point-sampler direct grab
MW-108	340	186-420	10/5/2011	Point-sampler direct grab
MW-108	370	186-420	10/5/2011	Point-sampler direct grab
MW-108	390	186-420	10/5/2011	Point-sampler direct grab

All samples were collected using a stainless steel, piston-operated, point sampling device lowered to the target depths in the water column using a geophysical logging winch and line. The equipment was provided and operated by the USGS. Samples were collected for analysis of TCL VOCs.

Preliminary Phase 1 Site Characterization Summary Report

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

The Sampling and Analysis Plan specified that, following geophysical logging, groundwater samples would be collected using inflatable packers. As noted previously, the use of packers was judged to be extremely risky given the cavernous nature of the borehole, and the possibility that collapsing material would trap the packer assembly causing forfeit of the borehole. The collection of point grab samples was agreed to be an adequate alternative sampling approach.

4.4.5 Well Construction

After reviewing the drilling notes, geophysical logging results, and screening-level analytical sample results, two screened intervals were chosen for each borehole. Screened interval selections and the rationale for each selection are summarized in the table below.

Well ID	Selected Screen Interval	Zone Monitored	Rationale
MW-107S	200 to 220 feet bgs	Water Table Zone Gasconade Dolomite	Screens first significant zone of water-bearing fractures and solution porosity below water table.
MW-107D	355 to 375 feet bgs	Transmissive Zone Eminence Dolomite	Screens zone of most significant solution porosity in interval of vertical flow convergence.
MW-108S	192 to 212 feet bgs	Water Table Zone Gasconade Dolomite	Screens first significant zone of water-bearing fractures and solution porosity below water table.
MW-108D	363 to 383 feet bgs	Transmissive Zone Eminence Dolomite	Screens zone of most significant solution porosity in interval of vertical flow convergence.

Well construction details were discussed and agreed upon during an October 19, 2011 conference call, which included representatives of the USEPA, the MDNR, the USGS, TRW, and ARCADIS.

Construction of the four monitoring wells was completed from October 31 to December 21, 2011. As specified in the work plan (ARCADIS 2010), care was used to ensure emplacement of appropriate grout seals and to minimize the chance of grout infiltrating to the screened intervals. Grout was emplaced in lifts of no greater than 10 feet and was typically allowed 24 hours to cure before another lift was added. Due

to the cavernous porosity, significantly more grout and sand were needed to construct the wells than would ordinarily be required based on the borehole depth and diameter.

Well construction logs are presented in Appendix A. Construction details are summarized in Table 4-2. Construction was completed as prescribed by the FSP, with the following exceptions:

- The screened interval of each well is 20 feet long, which is a deviation from the 10-foot lengths prescribed by the work plan (ARCADIS 2010). Based on the uniformity of low-level detections and the large vertical extent of the targeted fracture zones and voids, it was agreed that 20-foot screens were more appropriate to achieve the monitoring goals. The extent of the cavernous zones also made isolating anything less than a 20-foot interval challenging because the installation of well seals requires an interval of borehole without voids.
- Wells were constructed of 2.5-inch Schedule 80 polyvinyl chloride in lieu of the planned 2-inch-diameter materials. This change was made to better accommodate downhole sampling equipment.
- The well screen of MW-108S was installed with a pre-packed filter pack due to the cavernous nature of the borehole in its interval. The FSP identified pre-packed well screens as an acceptable option, if borehole conditions were not favorable for installation of a filter pack.

4.4.6 Well Development

Well development was conducted on January 31 and February 3, 2012, following the procedures specified in the FSP. Each well was mechanically surged to remove fines from the sand pack, and then purged with a submersible pump. Greater than 5 volumes of the well screen, riser, and filter pack were purged from each well, while monitoring field parameters for stability.

4.4.7 Investigation-Derived Waste Management

ARCADIS and the drilling subcontractor managed investigation-derived waste (IDW) as indicated in the FSP. In general, all solid and liquid IDW (including drill cuttings, drilling fluids, and purged groundwater) were containerized for appropriate treatment and disposal. Due to the volumes of IDW that were generated, roll-off boxes and frac tanks were staged on site for waste containerization. At the completion of each drilling

phase, composite waste characterization samples were collected to determine the appropriate disposal method for each waste stream. All waste characterization analyses showed the IDW to be nonhazardous. All clear water IDW was disposed of at the City of Sullivan publicly owned treatment works, after obtaining approval based on water clarity and laboratory results. Soil and rock cuttings, and unsettled drilling fluids were transported off site for disposal at a Subtitle D landfill permitted for special industrial waste. Appendix B contains the IDW documentation pertaining to the drilling activities performed during the Site Characterization.

4.4.8 Groundwater Monitoring

In the year following the installation and development of the new monitoring wells, four quarterly groundwater monitoring events were completed:

- March 4 to 13, 2012
- June 18 to 22, 2012
- September 10 to 13, 2012
- December 10 to 14, 2012

Each event included a total of 13 wells, comprising all existing Landfill wells, the Voss private water well, and USGS monitoring wells MW-1 and MW-1A. Sampling was completed as described in the FSP. The major elements of the monitoring plan included:

- At the start of each event, the water level in each well was gauged with an electronic water-level meter.
- At each well, a submersible pump was deployed within the screened interval and was used to purge the well at a gentle rate, adjusted to minimize drawdown.
- Purge water was monitored using a field water-quality meter equipped with a flow-through cell. The parameters of pH, specific conductance, dissolved oxygen, oxidation-reduction potential, turbidity, and temperature were monitored for stability.
- After stabilization, samples were collected for the list of analytes detailed in Table 4-2.

**Preliminary Phase 1
Site Characterization
Summary Report**

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

- Samples collected from the Voss private water well were collected using the dedicated downhole pump by filling the bottles directly from a spigot.

Additional quality assurance/quality control samples were collected at the frequency specified in the Quality Assurance Project Plan (QAPP; included at Attachment 4 to the RI/FS Work Plan [ARCADIS, 2010]). Samples were shipped under chain of custody protocols for laboratory analysis by TestAmerica, located in Canton, Ohio.

5. Investigation Findings

5.1 Quality Assurance/Quality Control

5.1.1 Data Usability Evaluation

All environmental samples were analyzed by TestAmerica, which in turn submitted analytical reports to ARCADIS. ARCADIS evaluated all laboratory analytical data from samples collected during the Site Characterization in accordance with the QAPP (Attachment 4 of the work plan [ARCADIS 2010]). The complete laboratory report packages from TestAmerica are provided on readable compact disks in Adobe Acrobat file format (Appendix E). The ARCADIS data validation reports for the Site Characterization activities and groundwater sampling events are included in Appendix D.

5.1.2 Quality Assurance/Data Validation Summary

Data validation is the procedure of reviewing data against a known set of criteria to verify data validity prior to its use. Data validation procedures have been developed by the USEPA to standardize the validation process for analytical results for both water- and soil-quality investigations, and are documented in the USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (USEPA 1994a) and USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review (Functional Guidelines; USEPA 1994b). The Functional Guidelines (USEPA 1994a) are intended to be used as a guide for evaluation of data generated under statements of work for organic and inorganic analyses associated with the USEPA Contract Laboratory Program (CLP). The Functional Guidelines (USEPA 1994a) also provide general data validation guidelines that can be applied to data generated using non-CLP analytical methods.

5.2 Surface-Water and Spring Characterization Results

5.2.1 Results of Winsel Creek Evaluation

The evaluation of Winsel Creek was completed on May 25, 2010. The principal tasks included gauging flow, measuring surface-water field parameters, and collecting surface-water samples for laboratory analysis. Gauging and field parameter results are summarized in Table 5-1. Analytical results are summarized in Tables 5-2 and 5-3. The

results of key constituents are presented on Figure 5-1. The principal findings include the following:

- Flow in the stream averaged approximately 2.5 cubic feet per second (cfs) on the day of sampling. The flow rate was greatest at the downstream location (SW-WC1), and incrementally less at each location farther upstream. The variation in measured flow is primarily attributed to changing conditions in the creek during the period of monitoring. On the day of sampling, the creek was in a period of steady recession following a rain event the previous day. Because it was necessary to conduct sampling in the upstream direction, the downstream sample was collected first. At each subsequent station, more time had elapsed and the overall streamflow had decreased further. The decline in flow is demonstrated by morning and afternoon measurements completed by the USGS at a stream crossing downstream of SW-WC2 (see notes in Table 5-1). Note also that the downstream location (SW-WC1) is downstream of the wastewater treatment plant discharge, and therefore receives a contribution of flow from the plant.
- Field parameter data are consistent with surface water derived chiefly from runoff. The parameter values (pH, temperature, and specific conductance) for the three upstream sample locations (SW-WC2, SW-WC3, and SW-WC4) are similar, suggesting that no significant inputs occur between the sample locations. The downstream location (SW-WC1) shows a slightly higher specific conductance and lower pH that is likely attributable to the treatment plant effluent.
- No VOCs were detected in the Winsel Creek surface-water samples.
- Detections of metals were within the expected range for natural waters, with no values exceeding MCLs.
- Detections of ionic compounds were within the expected range for natural waters. Concentrations of compounds associated with wastewater (e.g., sulfate, phosphorous) were marginally higher in the sample collected downstream of the wastewater treatment plant discharge (SW-WC01).

No springs or seeps were identified within the surveyed reach of Winsel Creek, either during the sampling event or during the reconnaissance completed in April 2010. No tributary branches intersected the creek between the upstream and downstream locations, except for the discharge from the City of Sullivan wastewater treatment plant (Figure 2-1).

In accordance with the Sampling and Analysis Plan, Winsel Creek was sampled only once. It is notable that the creek was not flowing during the October 2010 sampling event of springs and cave streams, consistent with its nature as a losing, intermittent stream.

5.2.2 Results of Spring and Cave Stream Evaluation

Monitoring of selected springs and cave streams in the SI Area was completed twice, in May and October 2010. During each event, the principal tasks were to gauge flow, measure water field parameters, and collect water samples for laboratory analysis. Gauging and field parameter results are summarized in Table 5-1. Analytical results are summarized in Tables 5-2 and 5-3. The results of key constituents are presented on Figure 5-1. The principal findings are discussed below.

5.2.2.1 Flow Gauging Results

- At all locations, the flow was higher during the May event than during the October event. For example, flow in the La Jolla Spring Cave stream had declined approximately 40% between the two events. All locations sampled during the May event were still flowing sufficiently to be sampled during the October event, except SW-LJ-02 (Figure 5-2), which is a tributary to the primary cave stream in Meramec Caverns and was found to be dry.
- The primary cave stream in Meramec Caverns (i.e., SW-LJ01 and SW-LJ03) was the largest discharge feature in the SI Area, excluding the Meramec River. The cave stream was gauged at 9.3 cfs in May and 5.8 cfs in October. Copper Hollow Spring was the next largest feature, discharging approximately 2.5 cfs in May and 0.35 cfs in October.
- The cave streams in Fisher Cave (with a maximum gauged value of 0.24 cfs) are relatively minor discharge features compared to La Jolla and Copper Hollow Springs. It is notable that in both May and October, the sum of flows of the two tributaries (SW-FC2 and SW-FC3) was greater than flow measured in the combined cave stream where it discharges from the cave mouth (SW-FC1). It appears that the cave stream loses flow in the final reach, potentially discharging through several small seeps on the bluff immediately north of the Fisher Cave entrance.

- Tin Cup Spring (SW-TC01) was the smallest discharge included in the monitoring program, with approximately 0.1 cfs during the May event and 0.01 cfs during October.

5.2.2.2 Field Parameters

- Field parameters of temperature, pH, and specific conductance were found within expected ranges for natural groundwater in each spring and cave stream sampling location.

5.2.2.3 Analytical Results

- TCE was the only VOC detected in the primary cave stream samples from Meramec Caverns (SW-LJ01 and SW-LJ03). TCE was not detected in other locations. No other VOCs were detected in any spring or cave stream samples. The VOC sampling results are summarized in the table below.

Sample Location	TCE Result		All other VOCs
	May 2010	Oct 2010	May and October 2010
SW-LJ01	1 µg/L	5.1 µg/L	non-detect
SW-LJ02	< 1 µg/L	5.0 µg/L	non-detect
All other spring and cave stream locations	non-detect	non-detect	non-detect

- The increase in TCE concentrations from May to October 2010 corresponds with a decrease in stream flow, as discussed above. Note that the maximum TCE concentration detected in the La Jolla Springs cavern (i.e., 5.1 µg/L) is greater than the maximum TCE concentration detected in groundwater in any well during any sampling event at the landfill (i.e., 3.2 µg/L at well MW-107S in December 2012). Groundwater analytical results are discussed further in Section 5.3.6.
- Detected levels of inorganic constituents in samples from the Meramec Caverns were consistent with concentrations expected for natural waters. No detected values were found above their respective MCLs. In general, dissolved solids concentrations were higher in October than in May, consistent with the lower flow rates and inferred longer average residence time of water in the cave system.

5.3 Groundwater Characterization Results

5.3.1 Landfill Condition

While completing reconnaissance, drilling, and sampling tasks at the Landfill, the condition of landfill was found to be excellent. In general:

- The cap was found to be in good condition throughout the landfill, with no areas of erosion or obvious recent subsidence. A healthy grass cover was observed, with no trees or shrubs.
- No areas of ponding were observed within the Landfill.
- No active seeps were observed within or adjacent to the Landfill.

Throughout the investigation activities, care was taken to minimize damage to the landfill cap. Precautions included postponing work for extensive periods of wet weather, when the landfill was judged to be too soft to bear the weight of the drill rigs and supporting equipment.

5.3.2 Geologic Observations

Observations about nature of the subsurface were generally consistent with expectations, based on prior work completed at the Landfill and at USGS monitoring well MW-1. The geologic framework is described in Section 2.4. Well logs for each boring, including geologic descriptions based on recovered drilling cuttings, are included in Appendix A. Cross-section B-B' (Figure 5-4) illustrates the principal stratigraphic contacts observed. The stratigraphy observed at the landfill is summarized in the table below.

**Preliminary Phase 1
Site Characterization
Summary Report**

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

Approximate Depth (feet bgs)	Unit	Characteristics
0 to 16 (both locations)	Cap and landfill waste materials	Clay cap above mixed general refuse
16 to 90 (MW-107) 16 to 85 (MW-108)	Roubidoux Formation Sandstone	White friable cherty sandstone, highly weathered near surface. Extremely cherty in places.
90 to 250 (MW-107) 85 to 240 (MW-108)	Gasconade Dolomite	Light gray to light brown cherty dolomite. Numerous voids observed throughout unit, both above and below water table (approximately 200 feet bgs). Zone of cavernous voids encountered in both boreholes, approximately 190 to 230 feet bgs.
250 to EOB (MW-107) 240 to EOB (MW-108)	Eminence Dolomite	Light gray, cherty dolomite, trace shale partings. Zone of infrequent voids in upper approximately 80 feet of unit. Zone of frequent voids approximately 340 feet bgs to EOB.

Note:

EOB = end of boring

Unit designations are based on observations of drill cuttings, and geophysical and well-video logging. Note that the transitions between the units are geologically subtle; therefore, the given contact depths should be considered approximate. The Roubidoux Formation, while predominantly sandstone, is characterized as containing a minor component of dolomite, particularly at its base. Both the Roubidoux Formation and the Gasconade Dolomite contain abundant chert. The diagnostic characteristic used to assign the contact for the top of the Gasconade was where sandstone fragments were no longer observed as a component of the drill cuttings.

The Gasconade Dolomite is known to sporadically include a sandstone member (the Gunter Sandstone) at the base of the unit. A coarse brown sandstone, inferred to be the Gunter Sandstone, was described in the boring for MW-1 at an elevation consistent with the base of the Gasconade Dolomite. However, no sandstone was observed at MW-107 or MW-108 at an equivalent elevation. The top of the Eminence Dolomite

shown in Section B-B' (Figure 5-4) was based on the appearance of trace shale partings in the rock cuttings, a diagnostic characteristic of the Eminence Dolomite.

The Eminence Dolomite is underlain by the Potosi Dolomite, at an estimated depth of 450 feet below the landfill (based on the contact observed in well MW-1). Neither MW-107 nor MW-108 is interpreted to have reached the upper contact of the Potosi Dolomite, each borehole terminating shallower than 450 feet bgs.

5.3.3 Open Borehole Groundwater-Level Monitoring

Periodic checks of groundwater depth made throughout the drilling process at each borehole showed that the static groundwater-level surface became progressively deeper as boreholes were drilled deeper. This observation is consistent with prior observations at the Site, and the known strong downward vertical gradient (e.g., the groundwater level in well MW-1A is a consistently 20 to 30 feet higher than in adjacent deeper well MW-1).

Open borehole groundwater levels are shown schematically on the geophysical boring logs in Appendix A. In general:

- The shallowest observations of steady groundwater levels were at depths of approximately 185 feet bgs in both boreholes, measured after the boreholes had been advanced to the base of a cavernous zone at approximately 235 feet bgs.
- Measured steady groundwater levels declined with each progressive deepening of the borehole.
- After completion of each borehole to their total depths (410 to 420 feet bgs), water levels had declined by approximately 30 feet.

The groundwater levels in a long open borehole are a complex average of the heads throughout the entire saturated section of the borehole; thus, the measured levels only indicate the strength of the downward gradient, without allowing rigid quantification. Note that the shallowest levels (approximately 185 feet bgs) are considered valid measurements of the groundwater table surface at the time of measurement, because the borehole had not yet been drilled significantly deeper than that level. After the boreholes had been drilled to their completed depths, the 30-foot decline in the borehole water level indicated that 30 feet of the saturated portion of the aquifer was temporarily dewatered within the borehole.

5.3.4 Geophysical Logging Results

Geophysical logging results confirm borehole observations and show general agreement with previous logging at MW-1. Logging results are presented schematically in Appendix A. The logging results support several general observations:

- Caliper logs identify several zones of solution-enlarged porosity. In both boreholes, the most pronounced region of voids occurred in the zone from approximately 190 to 230 feet bgs, in the range of the water-table surface.
- Video logging confirmed the presence of the major voids shown by the caliper log, but also showed that several smaller voids exist that were not clearly identified by the caliper. This was particularly evident in the basal 75 feet of each borehole (a zone described as the “transmissive zone”), where many voids of 1 foot or less in vertical extent only partly intersect the borehole. (Note that the 3-arm caliper does not expand fully if only one or two of the arms crosses a void).
- The video logging showed groundwater entering the borehole from within the shallow zone of cavernous porosity at depths of approximately 200 feet bgs. Note that this was above the water level in the open borehole at the time of logging, but below the level where the water table was initially observed during drilling (and also where it was subsequently observed in the completed shallow wells MW-107S and MW-108S).
- Fluid temperature and resistivity logs identified areas of the boreholes with apparent fluid communication with the formation. Perturbations in these water parameters are most distinct in borehole MW-108 adjacent to apparent voids or fractures in the transmissive zone (approximately 340 to 400 feet bgs). Perturbations in MW-107 are considerably less pronounced, suggesting less focused mixing with formation water.
- Natural gamma logs can be useful for distinguishing petrologically distinct strata and correlating units between boreholes. In general, the gamma profiles in MW-107 and MW-108 correlate well, though there are no clear gamma markers that can be used to distinguish between the formations (i.e., the petrology of the Gasconade and Eminence Dolomites is not clearly distinguishable based on gamma alone). In several cases, high gamma anomalies appeared to correlate with large open voids, which contained clay sediments (a common source of gamma radiation).

- Heat-pulse flow logging under ambient conditions showed several clear trends in both boreholes:
 - Strongly downward flow starting near the water surface (approximately 230 feet bgs) and continuing at a generally steady to slightly gaining rate to a depth of approximately 340 feet bgs. This indicates a strong influx of water to the borehole at the top of the zone of saturation, followed by nearly 100 feet in which relatively little additional groundwater enters the borehole.
 - A gradual decline in vertical flow rates down to zero vertical flow from approximately 340 to 380 feet bgs. This interval corresponds to the previously identified transmissive zone, where flow is discharging from the borehole into the aquifer.
 - Upward vertical flow in the very base of the each borehole, converging on the transmissive zone. This trend is consistent with logging completed previously at MW-1, where upward flow toward the transmissive zone was logged extending approximately 150 feet deeper into the stratigraphic section.
- The heat-pulse flow logging showed that the ambient downward flow rate in MW-108 is greater than in MW-107. The maximum rate flow in MW-107 was 0.9 gallon per minute (gpm). In MW-108, the flow exceeded the maximum rate measurable by a high-pressure flow meter (approximately 1 gpm). The difference appears to reflect a somewhat higher yield (i.e., better connection with the aquifer) in MW-108.

5.3.5 Screening Sample Results

As indicated in Section 4, a variety of screening-level samples were collected throughout the drilling and borehole testing process to evaluate the vertical distribution of COPCs and provide data to help select appropriate well screen intervals. Two distinctly different types of samples were collected:

- Slurry samples were collected above the water table, consisting of drilling water mixed with rock cuttings.
- Groundwater samples, collected as grab or post-pumping samples at several stages of increasing borehole depth.

These sample results must be interpreted somewhat differently, and therefore are described separately below.

5.3.5.1 Slurry Sample Results

Slurry sample results (Table 5-4) document the analytes that were detected in drilling fluids after it had been circulated through pulverized rock cuttings in the borehole, then bailed out and decanted. The slurry samples were not originally proposed in the Site Characterization Work Plan, are outside the normal environmental data quality objectives and protocol for the project. TRW only collected these samples as split samples because USEPA started collecting slurry samples during their drilling oversight. These samples were collected above the zone of saturation, and therefore are not groundwater samples. The results are intended to indicate whether a source of COPCs may exist in the unsaturated zone that may impact groundwater. The primary findings from the slurry samples include:

- The most significant VOCs detected in slurry samples are Freons and methylene chloride. The slurry sample collected from 97 feet bgs in MW-107 contained 1,600 µg/L Freon 21 and 3,500 µg/L methylene chloride.
- Some hydrocarbons were detected sporadically in slurry samples. Toluene (maximum concentration of 580 µg/L) was most significant, while m/p xylenes and benzene were detected at lower concentrations.
- Trace levels of the chlorinated VOCs PCE, TCE, and 1,1-dichloroethane (1,1-DCA) were detected only in the deepest samples (185 feet bgs in both MW-107 and MW-108), at concentrations of 2.6 µg/L or less. At 185 feet bgs, these samples may have been within the range of seasonal water table oscillation (or capillary effects), and therefore may be influenced by groundwater. The detected concentrations are, in fact, highly comparable to the shallow groundwater sample results described below.

5.3.5.2 Pumping and Grab Water Sample Results

In both boreholes, pumping and grab water samples contained a generally consistent mix of VOCs at low concentrations. VOC results are summarized in Table 5-5; inorganic results are summarized in Table 5-6. These data must be qualified by two important considerations:

- Because samples were collected in open boreholes, the sample results may not be specific to the depth at which they were collected. The longer the borehole, the greater uncertainty about the specificity of the samples. (Note that the depth and the open interval of each sample are indicated in the table headers.)
- Because vertical flow is known to occur in the boreholes (generally in the downward direction), samples are likely to be biased toward zones where water is entering the borehole, regardless of the depth they were collected.

While purging the wells in advance of sampling from the target depth improves the likelihood that the sample water is derived from near the sample intake, some uncertainty remains. Even with these uncertainties, several important observations may be drawn from the sampling results:

- Several Freon constituents (specifically Freon 11 and Freon 21) are the predominant VOC constituents detected, and were found in all grab water samples analyzed. Freon 21 was detected at the highest concentrations of any VOC, at a maximum of 100 µg/L. Freon 11 is present at concentrations as much as 32 µg/L.
- Chlorinated VOCs were detected at all depths, but only at low concentrations. The maximum concentrations of TCE were 3.2 µg/L in MW-107 and 3.3 µg/L in MW-108.
- Inorganic analytical results (Table 5-6) included no detections at levels of concern. Lead and chromium were both found below detection limits. Other metals and inorganic compounds are consistent with natural groundwater, with no levels of constituents suggestive of landfill leachate.

Screening-level borehole groundwater analytical data are consistent with slurry results, both in the nature of constituents and the concentrations detected. In particular, the presence of Freon 21 and Freon 11 as the most abundant VOCs agrees with the slurry sample data. The low levels of chlorinated VOCs also provides further evidence that the Landfill is not a significant source of those constituents.

5.3.6 Groundwater Sampling Results

Four consecutive quarterly rounds of groundwater monitoring at the Landfill have shown that no detected constituents are present in groundwater at levels of concern. Table 5-7 summarizes the analytical results for VOCs. Figure 5-5 presents the results

of the principal COPCs. A total of 15 VOCs were detected at least once in a groundwater sample. Of these constituents, none exceeded the USEPA's MCLs. The table below summarizes the detected constituents and related criteria. For constituents where MCLs have not been assigned, the USEPA Regional Screening Levels (RSLs; USEPA 2012) are shown for reference.

VOCs Detected in Groundwater	Maximum Detected Concentration (µg/L)	MCL (µg/L)	Tapwater RSL (µg/L)
PCE	1.8	5	
TCE	3.5	5	
cis-1,2-Dichloroethene	0.78	70	
1,1-DCE	0.67	7	
1,1,1-Trichloroethane	1.0	200	
1,1-DCA	3.2	--	2.4
Freon 11	160	--	1100
Freon 12	10	--	190
Freon 21	150	--	--
Toluene	2.9	1,000	
1,2,3-Trichlorobenzene	0.33	--	5.2
Methylene chloride	0.51	5	
1,2-Dichlorobenzene	0.15	600	
Chloroform	0.48	80	
Naphthalene	0.54	--	--

Note:

-- = level is not defined

Note that MCLs are not defined for the detected Freon constituents. For Freon 11 (trichlorofluoromethane) and Freon 12 (dichlorodifluoromethane), the detected levels are significantly below their respective RSLs. Neither an MCL nor an RSL has been assigned for Freon 21 (dichlorofluoromethane) or naphthalene. The maximum concentration of 1,1-dichloroethane, for which MCLs have not been defined, slightly exceed the RSL. Recall, however, that RSLs are non-enforceable generic risk-based screening levels, appropriate for "screening" only.

The distribution of VOCs detections in groundwater is presented on Figure 5-5. The data support several observations:

- The principal COPCs (i.e., TCE and Freon 11) are present at low but detectable concentrations in all shallow wells (i.e., wells that screen within the Gasconade Dolomite near the water table). No concentrations exceed MCLs, and no concentrations are suggestive of a significant source.

- For the two wells with long open intervals connecting the shallow zone with the deeper transmissive zone in the Eminence Dolomite (i.e., the Voss well and MW-1A), the detected constituents and range of concentrations are indistinguishable from shallow wells. Based on observations of ambient downward vertical flow in long open boreholes, it is inferred that the principal source of the water in those wells is from the shallow portion of their screened zones.
- The principal COPCs are present at detectable concentrations in both of the wells completed in the transmissive zone (MW-107D and MW-108D). Concentrations at MW-107D are markedly lower than at wells completed in the shallow zone, suggesting dilution of shallow concentrations within the transmissive zone. The distribution of detectable constituents and their concentrations at MW-108D are indistinguishable from those found in shallow groundwater, suggesting a relatively efficient vertical connection of shallow and deep groundwater at that location. Note that MW-108D is adjacent to a former sinkhole, though the vertical extent of the sinkhole structure is not likely to have extended as deep as the transmissive zone.
- The only location at which none of the principal COPCs were detected is well MW-1 which, as shown on Figure 5-4, is open at a depth below the transmissive zone. As discussed in Sections 5.3.4 and 5.3.7, groundwater appears to migrate vertically toward the transmissive zone from both above and below, such that wells completed below this zone are isolated from local surficial inputs.

The concentrations of inorganic constituents analyzed were all found within acceptable bounds (Table 5-8). While detectable concentrations were reported for 24 of the 26 inorganic analyses (a typical result for natural water samples), concentrations of constituents for which an MCL is assigned were all below their respective limits. The table below reports the maximum detected concentrations of the six inorganic analytes with assigned MCLs.

Detected Inorganic Constituent with MCL	Maximum Detected Concentration (µg/L)	MCL (µg/L)
Barium	370	2,000
Chromium	47	100
Lead	6	15
Nitrate-N	2,000	10,000
Nitrite-N	<100	1,000
Fluoride	78	4,000

Other metals and inorganic compounds are consistent with natural groundwater, with no levels of constituents suggestive of landfill leachate.

5.3.7 Groundwater Gauging and Interpretations of Flow

The depth to the zone of saturation beneath the landfill is between approximately 160 and 200 feet bgs, varying seasonally and by location.

Due to the strength of the downward gradient, the water levels in shallow wells are not necessarily reliable indicators of the depth of the water table. The wells with longer open intervals (such as MW-1A), or wells that are screened deeper in the aquifer, are biased low relative to the apparent water table and would not be appropriate for contouring. For this reason, potentiometric surface maps have not been prepared.

Though the precise depth of the groundwater table is uncertain, elevation of the zone of saturation is generally 130 feet or more deeper than Winsel Creek or other surface-water features; therefore, it is impossible for phreatic groundwater to discharge to surface water locally.

Due to the karst nature of the bedrock aquifer, interpretations of flow based on groundwater level data must be heavily qualified. In all aquifers, the hydraulic gradient is a central parameter needed to interpret patterns of groundwater flow. However, in karst aquifers, the normal assumption that flow occurs more or less uniformly throughout the aquifer volume is invalid. Flow in karst aquifers is almost entirely focused within interconnected networks of solution-enlarged voids, termed conduits. Therefore, the direction of flow cannot be directly inferred from a potentiometric surface map. Groundwater can only flow from areas of higher head to lower head, but will only do so following the available conduit network pathways.

Flow patterns at the Landfill cannot be evaluated without also considering the vertical component of flow. Figure 5-6 illustrates the relationship between the water-level elevation and the well depth. The plot shows that the lowest water-level elevations at the landfill are measured at wells completed within the hydrostratigraphic interval of the Eminence Dolomite referred to as the transmissive zone (i.e., MW-107D and MW-108D). This observation is consistent with geophysical logging completed at MW-107 and MW-108 (and previously at MW-1), which showed convergence of vertical flow toward the transmissive zone. The patterns suggest that karst

development in the transmissive zone is significant relative to the bulk of the aquifer, and that it dominates the lateral transmission of water in the aquifer.

While head relationships suggest that flow should occur between the shallow aquifer and the transmissive zone, where flow paths exist, the extreme differences in head also suggest that hydraulic connections are limited either in frequency or efficiency. It can be inferred that the bulk movement of shallow groundwater has both a lateral and vertical component, with local flow paths varying enormously depending on the geometry of the conduit network. Where vertical pathways exist, they are expected to act as drains to the deeper groundwater system, funneling water down to the transmissive zone. The existence of vertical connections appears clear based on groundwater sampling results at MW-107D and MW-108D, which contain a highly similar mixture of VOCs relative to shallow groundwater, though notably at concentrations below MCLs even immediately beneath the Landfill.

Inferences about groundwater flow patterns in the transmissive zone can be drawn from the hydraulic setting. For a water-level elevation of approximately 690 feet amsl, as occurs in the transmissive zone beneath the Landfill, the nearest area where the ground surface descends to that elevation (and thus where groundwater could potentially discharge) is approximately 1.2 miles due east in Copper Hollow. To the north or northwest (e.g., staying within the Winsel Creek drainage basin), the nearest areas of equivalent elevation are at least 4.5 miles distant, and far less probable discharge locations. The major spring discharges in and adjacent to Copper Hollow (i.e., La Jolla and Copper Hollow Springs) are the most probable locations for water in the transmissive zone beneath the Landfill to discharge. As illustrated in cross-section A-A' (Figure 2-4), the elevation of these major spring discharges is comparable to that of the transmissive zone. Meramec Caverns appears to have formed in the same approximate zone of the Eminence Dolomite. It is also important to note that no significant perennial groundwater discharges occur at higher elevations than these springs. This provides evidence that shallower groundwater, as is found in the Gasconade Dolomite beneath the Landfill, drains completely into the transmissive zone and does not persist as an independent shallow aquifer with a significant role in lateral groundwater transport.

The volume of groundwater discharge at La Jolla or Copper Hollow Springs indicates that they have significant catchments, of which the Landfill would be a minor component. Given the lower concentrations of TCE found in groundwater at the Landfill, the dilution that must inevitably occur between the Landfill and La Jolla Springs

**Preliminary Phase 1
Site Characterization
Summary Report**

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

Cave (if a connection exists), and the documented existence of background sources of TCE, there is no basis to ascribe the TCE detections in the cave to the Landfill.

6. Nature and Extent of Constituents of Potential Concern

6.1 Identified Constituents of Potential Concern

As described in Section 5, no constituents detected at the Landfill occur in groundwater at concentrations above MCLs. The sample results indicate the presence of 15 VOCs at detectable concentrations:

- Chlorinated VOCs: PCE, TCE, cis-1,2-dichloroethene, 1,1-DCE, 1,1,1-trichloroethane, 1,1-DCA
- Freon compounds: Freon 11, Freon 12, Freon 21
- Other VOCs: Toluene, 1,2,3-trichlorobenzene, methylene chloride, 1,2-dichlorobenzene, chloroform, naphthalene

No inorganic compounds were detected in groundwater at levels of potential concern.

In surface-water and spring samples, the only location where a VOC was detectable was in the primary cave stream at La Jolla Springs Cave (TCE at a maximum of 5.1 µg/L, slightly above the MCL). Given the lower concentrations of TCE found in groundwater at the Landfill, the dilution that must inevitably occur between the Landfill and La Jolla Springs Cave (if a connection exists), and the documented existence of background sources of TCE, there is no basis to ascribe the TCE detections in the cave to the Landfill.

6.2 Potential Source

The low-level concentrations of VOCs detected in groundwater immediately beneath the Landfill are interpreted to be related to distributed residual landfill wastes. The absence of any source level or moderately higher concentration sample results at any of the completed investigation locations suggests that the Landfill is not the source area for the TCE detected at the Oak Creek Village Well and fully does not account for the TCE levels found in La Jolla Springs.

In the transmissive zone (i.e., MW-107D and MW-108D) the detectable concentrations of VOCs are consistent with detections in shallower groundwater, and may be attributed at least in part to a Landfill source. Groundwater in the transmissive zone

may also reflect a component background-sourced TCE and other constituents, documented to exist during other investigations (e.g., MDNR 2005).

6.3 Media of Interest

Groundwater is the only media of potential interest at the Landfill. As noted previously, Site data do not support the existence of an impact to surface water.

6.4 Extent of Constituents of Potential Concern in Groundwater

Low-level detectable VOCs are present in all monitoring wells completed within and surrounding the Landfill. No levels exceed MCLs; therefore, the extent of groundwater impact is interpreted to be nonexistent. The extent to which VOCs may remain at detectable concentrations is unknown, but is not anticipated to be extensive. In shallow groundwater, net-lateral movement is expected to be limited by a tendency for groundwater to migrate vertically downward toward the transmissive zone. Constituents entering the transmissive zone are anticipated to dilute quickly. Levels of constituents at deep well MW-108D are commensurate with shallow groundwater concentrations, indicating that the well is proximal to an area of shallow groundwater input.

The general uniformity of detectable constituents and constituent concentrations provides an additional basis to validate the usefulness of the monitoring well network. Monitoring wells are often poor means of evaluating groundwater quality in karst aquifers due to the irregularity of conduit networks and the low probability that a well will intersect an important conduit pathway. These limitations apply at the Landfill; however, the uniformity of detections suggests a higher degree of mixing and flow interconnection than are normally expected in karst. This condition greatly reduces the possibility that a high concentration source mass exists that is not properly monitored by the current well network. The detections at deep wells MW-107D and MW-108D, in particular, verify their appropriateness as monitoring points for evaluating potential groundwater impacts to the transmissive zone.

The maximum detected concentrations of TCE found at the Landfill are sufficiently low that there is no reasonable probability that the TCE detected at La Jolla Springs Cave (2 miles east) and the Oak Grove Village wells (1 mile southwest) originated at the Landfill. The major points supporting this argument are summarized below:

- Concentrations of TCE at the Oak Grove Village Wells (OGV Well 1 and 2) have been detected as high as 99.4 µg/L (Benham, 2005). Sample results for these wells are variable, but are commonly greater than 50 µg/L, particularly during the most recent years (2005, 2006, and 2007).
- In order for the Landfill to be a plausible source of TCE to the Oak Grove Village Wells, a complete flow path would need to exist (which is highly uncertain) and the landfill would need to contain a zone of source-level TCE concentrations. No data from the Landfill suggest that a high-concentration TCE source exists. Concentrations of TCE in groundwater at the Landfill have historically not exceeded 6.8 µg/L (at well MW-104 in May 2002; see historical data in Appendix C). Historically, the private Voss well, located immediately adjacent to the landfill and actively pumped, has also not exceeded 5.4 µg/L (also in May 2002; based on MDNR supplied data). With the current density and distribution of monitoring wells and sampling data, a source of TCE sufficient to support the level of concentrations detected at the production wells could not reasonably exist at the Landfill and remain undetected.
- While a flow connection from the Landfill to La Jolla Springs Cave is plausible, it is not possible for TCE originating at the Landfill to be transported 2 miles through the bedrock aquifer without any attenuation by dilution or other processes. A spring, like a pumping well, is a flow collector; thus any source contributing TCE within the spring's catchment will be significantly diluted by the clean water contributed within the rest of the catchment. The highest concentration of TCE detected in the cave (5.1 µg/L in October 2010) is greater than the highest concentration of TCE detected in groundwater at the Landfill during the last four quarters of sampling (3.5 µg/L at MW-4 in March 2012).

6.5 Data Trend Analysis

The four recent quarterly rounds of groundwater monitoring data, discussed previously, may also be shown to be representative of historical conditions at the Landfill. Historical results and trend plots, including results dating to 1992, are included for selected indicator parameters in Appendix C. The plots include TCE, its breakdown products cis-1,2-dichloroethene and vinyl chloride, and Freon constituents. The trend plots support several observations:

**Preliminary Phase 1
Site Characterization
Summary Report**

Oak Grove Village Well
Superfund Site – OU2
City of Sullivan Landfill

- Historical maximum concentrations of TCE include values as high as 6.8 µg/L (slightly above the MCL of 5 µg/L), but no levels indicative of a significant source. No concentrations greater than the MCL have been detected since 2006.
- Other than TCE, no historical concentrations of constituents have occurred above MCLs. For Freon constituents, no historical concentrations have occurred above RSLs.
- Some seasonal and location-by-location variability in constituent concentrations is evident, likely reflecting minor shifts in flow patterns due to changes in aquifer stage. It is important to note that the range of variability observed remains consistently below MCLs or levels that suggest a fundamental change in the conditions of the Site.

7. Potential Exposure Pathways

No exposure pathways have been identified at the Landfill. In particular:

- Levels of constituents in groundwater are safely below applicable criteria, and do not pose a risk for potable water use in the vicinity.
- The landfill's leachate collection system is understood to properly manage any landfill leachate production. No leachate was observed in borings and no leachate seeps were observed at grade either on the Landfill perimeter or outside the Landfill approaching Winsel Creek. Winsel Creek is a consistently losing stream, and is not affected by the Landfill.
- The springs and cave streams monitored east of the Landfill are interpreted to be likely discharge locations for groundwater traveling beneath the landfill. However, the absence of significant groundwater impacts at the Landfill eliminates the groundwater discharge locations as potential receptors.

While the levels of constituents detected in groundwater at the landfill are below concentrations that require action, modifications to the construction of two existing wells located adjacent to the Landfill would help limit the flow of shallow groundwater into the transmissive zone. Both the Voss private water well and USGS monitoring well MW-1A are constructed with long open intervals that extend through shallow groundwater down to, if not into, the transmissive zone.

8. Summary and Conclusions

The Phase 1 Site characterization has fulfilled the objectives of the RI/FS process, as summarized below:

- Provided data to better understand and describe the SI Area's physiography, geology, and hydrology.
- Shown that the Landfill is not a source area of COPCs to groundwater at levels above MCLs.
- Shown the absence of surface migration pathways and, to the extent feasible in a karst environment, described the nature of groundwater migration pathways.
- Demonstrated the absence of detectable COPCs related to the Landfill in Winsel Creek, and in springs and cave streams within the SI Area.

Multiple lines of evidence suggest that additional characterization, a risk assessment, or remediation are not warranted or justified at this Site:

- No seeps were observed on the periphery of the Landfill, and are thereby eliminated as a potential exposure pathway. The absence of seeps at the landfill is consistent with the long-term decline in leachate production observed in the Landfill's leachate collection system.
- No seeps were observed between the Landfill and Winsel Creek, and are thereby eliminated as a potential exposure pathway.
- No VOCs were detected in the Winsel Creek samples collected as part of the Phase 1 Site Characterization
- The detected levels of ionic compounds from samples collected in Winsel Creek were within the expected range for natural stream water. Concentrations of compounds associated with wastewater (e.g., sulfate, phosphorous) were marginally higher in the Winsel Creek sample collected downstream of the wastewater treatment plant outfall.

- All detections of TCE in the Landfill sampling network, including the four new wells (MW-107S, MW-107D, MW-108S, and MW-108D) were below MCLs for four quarterly sampling events. The maximum concentration of TCE detected at that time was 3.5 µg/L. By comparison, one sample collected from the stream at the La Jolla Spring Cave Complex contained a TCE concentration of 5.1 µg/L; TCE concentrations in samples collected at the Oak Grove Village Well have historically ranged as high as 99.4 µg/L (Benham 2005).
- The new wells installed as part of the Phase I Site Characterization were specifically located by the USEPA in the areas where potential landfill impact to groundwater would be observed; however, TCE was not detected at concentrations that exceeded MCLs through four quarters of groundwater sampling.
- The Landfill is not a source of the TCE-impacts detected at either the Oak Grove Village Well or the La Jolla Springs Cave Complex. This conclusion is based on the low concentrations found in groundwater beneath the Landfill, and the dilution that must inevitably occur between the Landfill and La Jolla Springs Cave or the Oak Grove Village Well (if a flow connection exists). With the density of monitoring wells at the Landfill, and the uniformly low concentrations of TCE detected, it is highly implausible that a significant source could exist at the Landfill that would have gone undetected. With these considerations, and the documented existence of other sources of TCE in the area, there is no basis to ascribe the TCE detections in the cave or the Oak Grove Village Well to the Landfill.
- TCE concentrations in groundwater directly beneath the landfill are orders of magnitude less than TCE-impacted groundwater from the Oak Grove Village Well.

Based on the results of this investigation, no assessment of risk to human health and the environment is required, and no remedial action is necessary.

While the levels of constituents detected in groundwater at the landfill are below concentrations that require action, modifications to the construction of two existing wells located adjacent to the Landfill would help limit the flow of shallow groundwater into the transmissive zone. Both the Voss private water well and USGS monitoring well MW-1A are constructed with long open intervals that extend through shallow groundwater down to, if not into, the transmissive zone. With the known downward component of flow in open boreholes, discussed previously, it is recommended that the

440	480											440
Notes: See well construction log for complete construction details. Sample results noted as "Discrete" collected as grab samples by point-sampling device with borehole open to total drilled depth. Sample results noted as "Pump" collected after purging borehole with drilled depth as posted. Geophysical logging performed by												
Acronyms & Abbreviations: ft bgs = feet below ground surface; AMSL = above Mean Seal Level; SAA = same as above; NA = not available; SS = stainless steel; PVC = polyvinyl chloride; HPFM = heat-pulse flow meter; TD = total borehole depth

690 230					Vuggy with fractures @226.5-228.4 ft bgs
685 235					Vuggy @232.8-235.5 ft bgs Abundant chert and chert breccia @238-241.1 ft bgs with some large voids
680 240		80% Dolostone, light grey (2.5Y7/1), fine crystalline to aphanitic, hard; 20% Chert, grey (5Y5/1) to white (10YR8/1), aphanitic, hard, brittle; trace red (2.5YR5/6) iron stain material, med hard to soft; trace Shale, light greenish			Small vugs in more regular bedded dolostone
675 245		50% dolostone as above, 50% chert, dark grey (5Y4/1) to white, some banded, some with black stain, a few pieces show relict oolite structure			Chert rich, irregular bedding, with fractures and some Vugs @244-252 ft bgs
670 250		60% Dolostone as above, 40% Chert as above; 2 pieces of clear rhombic calcite crystals may indicate void filling			Shale lens @252.3 ft bgs
665 255		EMINENCE DOLOMITE As above; few chert pieces have a drusy surface indicating vugs; one piece of calcite as above			Shale lamina @256.3 ft bgs and @ 257.3 ft bgs
660 260		50% Dolostone as above; 45% Chert, light grey to white, some appears weathered, some with drusy surfaces; 5% Shale, greenish grey (10G5/1), soft, aphanitic			Vugs in fractured irregular bedded cherty dolostone @260-272 ft bgs
655 265		70% Dolostone as above; 25% Chert as above; 5% Shale as above, possible void 264.8-265.2 ft bgs			
650 270		80% Dolostone as above; 20% Chert as above; trace Shale as above			Enlarged voids from 275.3-286.5 ft bgs; Vuggy @ 277 ft bgs
645 275		85% Dolostone, grey (2.5Y6/1) to light grey (2.5Y7/1), some pieces with vuggy porosity, otherwise uniform, fine crystalline, hard; 15% Chert as above; trace Shale as above, trace red iron stain material			

	Remarks: bgs = below ground surface; NA = Not Applicable/Available.

SDGs #A0E280509 and A0E280605

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 18994R
Review Level: Tier II
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) A0E280509 and A0E280605 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample Delivery Group	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						VOC	SVOC	PCB	MET	MISC
A0E280509	SW-CH01-201005261550	A0E280509-001	Water	05/26/10		X			X	
	SW-TC01-201005261740	A0E280509-002	Water	05/26/10		X			X	
	SW-LJ01-201005270800	A0E280509-003	Water	05/27/10		X			X	X
	SW-LJ02-201005270850	A0E280509-004	Water	05/27/10		X			X	X
	SW-LJ03-201005270920	A0E280509-005	Water	05/27/10		X			X	X
	EB01-20100527	A0E280509-006	Water	05/27/10		X			X	X
	TB01-20100526	A0E280509-007	Water	05/27/10		X				
A0E280605	SW-WC1-201005251100	A0E280605-001	Water	05/25/10		X			X	X
	SW-WC2-201005251200	A0E280605-002	Water	05/25/10		X			X	X
	SW-WC3-201005251300	A0E280605-003	Water	05/25/10		X			X	X
	SW-WC4-201005251400	A0E280605-004	Water	05/25/10		X			X	X
	DUP01-20100525	A0E280605-005	Water	05/25/10	SW-WC2-201005251200	X			X	X
	SW-FC1-20100526	A0E280605-006	Water	05/26/10		X				
	SW-FC2-20100526	A0E280605-007	Water	05/26/10		X				
	SW-FC3-20100526	A0E280605-008	Water	05/26/10		X				
	TB01-20100525	A0E280605-009	Water	05/25/10		X				

Note:

- Miscellaneous analyses include alkalinity, orthophosphate, ammonia, bromide, chloride, sulfate, nitrite, nitrate, fluoride, and total phosphorus.
- The matrix spike/matrix spike duplicates (MS/MSD) were performed on sample locations SW-LJ01-201005270800 and SW-WC1-201005251100.

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X

11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample locations associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table.

Sample Locations	Compound	MS Recovery	MSD Recovery
SW-LJ01-201005270800	Dichlorodifluoromethane	<LL but >10%	<LL but >10%
	cis-1,3-Dichloropropene	<LL but >10%	AC
	1,1,2,2-Tetrachloroethane	<LL but >10%	AC
	Vinyl chloride	<LL but >10%	<LL but >10%
SW-WC1-201005251100	Dichlorodifluoromethane	<LL but >10%	<LL but >10%
	2,2-Dichloropropane	<LL but >10%	AC
	cis-1,3-Dichloropropene	<LL but >10%	<LL but >10%
	trans-1,3-Dichloropropene	<LL but >10%	AC
	Ethylbenzene	<LL but >10%	AC
	Hexachlorobutadiene	<LL but >10%	<LL but >10%
	Styrene	<LL but >10%	AC
	1,1,2,2-Tetrachloroethane	<LL but >10%	<LL but >10%
	Tetrachloroethene	<LL but >10%	AC
	Vinyl chloride	> UL	AC

AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > four times the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

5. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the LCS/LCSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
SW-CH01-201005261550 SW-TC01-201005261740 SW-LJ01-201005270800 SW-LJ02-201005270850 SW-LJ03-201005270920 EB01-20100527 TB01-20100526	Dichlorodifluoromethane	<LL but >10%	<LL but >10%
SW-WC1-201005251100	Bromoform	<LL but >10%	<LL but >10%
SW-WC2-201005251200	Dibromochloromethane	<LL but >10%	<LL but >10%
SW-WC3-201005251300	Dichlorodifluoromethane	<LL but >10%	<LL but >10%
SW-WC4-201005251400	Dichlorodifluoromethane	<LL but >10%	<LL but >10%
DUP01-20100525	cis-1,3-Dichloropropene	<LL but >10%	<LL but >10%
SW-FC1-20100526	trans-1,3-Dichloropropene	<LL but >10%	<LL but >10%
SW-FC2-20100526	trans-1,3-Dichloropropene	<LL but >10%	<LL but >10%
SW-FC3-20100526	trans-1,3-Dichloropropene	<LL but >10%	<LL but >10%
TB01-20100525	1,1,2,2-Tetrachloroethane	<LL but >10%	<LL but >10%

AC = Acceptable

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
SW-WC2-201005251200/ DUP01-20100525	All Compounds	U	U	AC

AC Acceptable
NC Not compliant

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010, 2320B, 9056, SM4500 NH₃, and SM4500 P-E. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

- U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

- B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

- E The reported value is estimated due to the presence of interference.

- N Spiked sample recovery is not within control limits.

- * Duplicate analysis is not within control limits.

- Validation Qualifiers

- J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

- UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

- UB Analyte considered non-detect at the listed value due to associated blank contamination.

- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010B	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL.

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

The MS/MSD analysis exhibited acceptable recoveries and RPD between recoveries.

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis. The MS/MSD recoveries exhibited acceptable RPD

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
SW-WC2-201005251200/ DUP01-20100525	Calcium	13900	14100	1.4%
	Magnesium	5010	5040	0.6%
	Sodium	11900	12000	0.8%
	Strontium	43.9	43.4	1.1%
	Silica	4390	4350	0.9%

AC Acceptable
NC Not compliant

The calculated RPDs between the parent sample and field duplicate were acceptable.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution was not performed on a sample location within this SDG.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Alkalinity by SM 2320B	Water	14 days from collection to analysis	Cool to 4°C±2°C.
Ammonia-N by SM4500 NH ₃	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 9056 (Chloride, Fluoride, Sulfate, Bromide)	Water	28 days from collection to analysis	Cool to 4°C±2°C.
SW-846 9056 (Nitrate, Nitrite, Orthophosphate)	Water	48 hours from collection to analysis	Cool to 4°C±2°C.
Total Phosphorus by SM4500 P-E	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.

The analyses that exceeded the holding time are presented in the following table.

Sample Locations	Analyte	Holding Time	Criteria
SW-WC2-201005251200 SW-WC3-201005251300 SW-WC4-201005251400	Nitrate Nitrite Orthophosphate	>48 hours but >96 hours	<48 hours

Sample results associated with sample locations analyzed by analytical method SW-846 9056 were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results

less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
SW-LJ02-201005270850 SW-LJ03-201005270920	Orthophosphate	Detected sample results >RL and <BAL	"UB" at detected sample concentration

RL = reporting limit

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
SW-LJ01-201005270800	Orthophosphate	>UL	>UL
	Ammonia	<LL but >10%	AC

AC = Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent

and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

An MS/MSD was performed in replacement of the laboratory duplicate. All analytes associated with MS/MSD recoveries exhibited RPD within control limits.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
SW-WC2-201005251200/ DUP01-20100525	Alkalinity	62.3	62.5	0.3%
	Orthophosphate	0.5 U	0.5	AC
	Chloride	12.7	12.7	0.0%
	Nitrate	0.20	0.20	0.0%
	Sulfate	4.7	4.7	0.0%

AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

5. Laboratory Control Sample (LCS)/Laboratory Control Sample Duplicate (LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%. The relative percent difference (RPD) between the LCS/LCSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

All LCS recoveries were within control limits.

6. System Performance and Overall Assessment

The laboratory narrative indicates that the CCV associated with samples SW-LJ01-201005270800, SW-LJ02-201005270850, SW-LJ03-201005270920 and EB01-20100527 was below control limits and were reanalyzed outside holding time. The results will be taken from the original analysis and qualified as estimated (J).

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA VALIDATION CHECKLIST FOR GENERAL CHEMISTRY

General Chemistry: EPA 1677	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier II Validation					
Holding times		X	X		
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X	X		
B. Equipment blanks					X
Laboratory Control Sample (LCS) %R		X		X	
Laboratory Control Sample Duplicate(LCSD) %R		X		X	
LCS/LCSD Precision (RPD)		X		X	
Matrix Spike (MS) %R		X	X		
Matrix Spike Duplicate(MSD) %R		X	X		
MS/MSD Precision (RPD)		X		X	
Field/Lab Duplicate (RPD)		X		X	
Dilution Factor		X		X	
Moisture Content					X

%R - percent recovery, RPD - relative percent difference,
 %D – difference

Data Review

SULLIVAN, MISSOURI

Volatile Analyses.

SDGs #A1A060436 and A1A070479

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 18997R
Review Level: Tier III
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) A1A060436 and A1A070479 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample Delivery Group	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						VOC	SVOC	PCB	MET	MISC
A1A060436	MW-108BH@195(20110105)	A1A060436001	Water	1/5/2011		X				
	TB-20110105	A1A060436002	Water	1/5/2011		X				
A1A070479	MW-108BH@210(20110106)	A1A070479001	Water	1/6/2011		X				
	TB-20110106	A1A070479002	Water	1/6/2011		X				

Note:

- 1 The matrix spike/matrix spike duplicates (MS/MSD) were performed on sample location MW-108BH@210(20110106).

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
All sample locations	CCV %D	Dichlorodifluoromethane	-22.3%
		Chloromethane	-21.2%
		Carbon tetrachloride	25.1%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01 ¹	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01 ¹	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 15% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >20% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >20% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD exhibited acceptable recoveries and RPD between the MS/MSD recoveries.

8. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
All sample locations	Carbon tetrachloride	>UL	-

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not analyzed on a sample within this data set.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

11. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA VALIDATION CHECKLIST FOR VOCs

Data Review

SULLIVAN, MISSOURI

Volatile Analyses.

SDG #240-15149

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 19009R
Review Level: Tier III
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) 240-15149 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
					VOC	SVOC	PCB	MET	MISC
MW-1A(09122012)	240-15149-1	Water	9/12/2012		X			X	X
DUP-01(09122012)	240-15149-2	Water	9/12/2012	MW-1A(09122012)	X			X	X
VOSS WELL(09122012)	240-15149-3	Water	9/12/2012		X			X	X
EB-01(09132012)	240-15149-4	Water	9/13/2012		X			X	X
MW-104(09132012)	240-15149-5	Water	9/13/2012		X			X	X
MW-105(09132012)	240-15149-6	Water	9/13/2012		X			X	X
MW-101(09132012)	240-15149-7	Water	9/13/2012		X			X	X
TRIP BLANK_9/13/2012	240-15149-8	Water	9/13/2012		X				

Note:

- 1 The matrix spike/matrix spike duplicates (MS/MSD) were performed on sample location VOSS WELL(09122012).
- 2 Miscellaneous analyses include alkalinity, orthophosphate, ammonia, bromide, chloride, sulfate, nitrite, nitrate, fluoride, and total phosphorus.

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits, with the exception of the compounds presented in the following table.

Sample Locations	Initial/Continuing	Compound	Criteria
MW-1A(09122012) DUP-01(09122012) VOSS WELL(09122012)	CCV %D	Hexachlorobutadiene	-25.5%
EB-01(09132012)		Trichlorofluoromethane	23.6%
MW-104(09132012)		Hexachlorobutadiene	-23.3%
MW-105(09132012)		Naphthalene	-30.1%
MW-101(09132012)		1,2,4-Trimethylbenzene	-24.4%
TRIP BLANK_9/13/2012		1,2,3-Trichlorobenzene	-27.3%

The criteria used to evaluate the initial and continuing calibration are presented in the following table. In the case of a calibration deviation, the sample results are qualified.

Initial/Continuing	Criteria	Sample Result	Qualification
Initial and Continuing Calibration	RRF <0.05	Non-detect	R
		Detect	J
	RRF <0.01 ¹	Non-detect	R
		Detect	J
	RRF >0.05 or RRF >0.01 ¹	Non-detect	No Action
		Detect	
Initial Calibration	%RSD > 15% or a correlation coefficient <0.99	Non-detect	UJ
		Detect	J
	%RSD >90%	Non-detect	R
		Detect	J
Continuing Calibration	%D >20% (increase in sensitivity)	Non-detect	No Action
		Detect	J
	%D >20% (decrease in sensitivity)	Non-detect	UJ
		Detect	J
	%D >90% (increase/decrease in sensitivity)	Non-detect	R
		Detect	J

¹ RRF of 0.01 only applies to compounds which are typically poor responding compounds (i.e., ketones, 1,4-dioxane, etc.)

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD exhibited acceptable recoveries and RPD between the MS/MSD recoveries.

8. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

The LCS analysis exhibited recoveries within the control limits.

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-1A(09122012)/ DUP-01(09122012)	1,1-Dichloroethane	0.56 J	0.58 J	AC
	Cis-1,2-Dichloroethene	0.45 J	0.49 J	AC
	Dichlorodifluoromethane	0.77 J	0.71 J	AC
	Dichlorofluoromethane	16	16	0.0%
	Tetrachloroethene	1 U	0.3 J	AC
	Trichloroethene	0.82 J	0.82 J	AC
	Trichlorofluoromethane	6.4	6.5	1.5%

AC = Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

Sample results associated with compound that exhibited a concentration greater than the linear range of the instrument calibration are summarized in the following table.

Sample ID	Compound	Original Analysis	Diluted Analysis	Reported Analysis
VOSS WELL(09122012)	Dichlorofluoromethane	--	79 D	79 D
	Trichlorofluoromethane	--	62 D	62 D
MW-104(09132012)	Dichlorofluoromethane	--	53 D	53 D

Note: In the instance where both the original analysis and the diluted analysis sample results exhibited a concentration greater than and/or less than the calibration linear range of the instrument; the sample result exhibiting the greatest concentration will be reported as the final result.

Sample results associated with compounds exhibiting concentrations greater than the linear range are qualified as documented in the table below when reported as the final reported sample result.

Reported Sample Results	Qualification
Diluted sample result within calibration range	D
Diluted sample result less than the calibration range	DJ
Diluted sample result greater than the calibration range	EDJ
Original sample result greater than the calibration range	EJ

11. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010, 2320B, 9056, SM4500 NH₃, and SM4500 P-E. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
 - B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).
- Quantitation (Q) Qualifiers
 - E The reported value is estimated due to the presence of interference.
 - N Spiked sample recovery is not within control limits.
 - * Duplicate analysis is not within control limits.
- Validation Qualifiers
 - J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
 - UB Analyte considered non-detect at the listed value due to associated blank contamination.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010B	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-1A(09122012) DUP-01(09122012) MW-104(09132012)	Manganese	Detected sample results <RL and <BAL	"UB" at the RL

RL = reporting limit

3. Calibration

Satisfactory instrument calibration is established to provide that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument's continuing performance is satisfactory.

3.1 Initial Calibration and Continuing Calibration

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 for all non-ICP analytes and all initial calibration verification standard recoveries were within control limits.

All continuing calibration verification standard recoveries were within the control limit.

3.2 CRDL Check Standard

The CRDL check standard serves to verify the linearity of calibration of the analysis at the CRDL. The CRDL standard is not required for the analysis of aluminum (Al), barium (Ba), calcium (Ca), iron (Fe), magnesium (Mg), sodium (Na), and potassium (K). The criteria used to evaluate the CRDL standard analysis are presented below in the CRDL standards evaluation table (if applicable).

All CRDL standard recoveries were within control limits.

3.3 ICP Interference Control Sample (ICS)

The ICS verifies the laboratories interelement and background correction factors.

All ICS exhibited recoveries within the control limits.

4. Matrix Spike (MS)/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
VOSS WELL(09122012)	Silica	AC	134%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to all sample results associated with this SDG.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis. The MS/MSD recoveries exhibited acceptable RPD.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-1A(09122012)/ DUP-01(09122012)	Barium	110 J	120 J	AC
	Calcium	61000	65000	6.3%
	Magnesium	32000	34000	6.0%
	Manganese	0.64 J	0.58 J	AC
	Potassium	3000 J	3200 J	AC
	Silica	11000	8700	23.3%
	Sodium	5300	5700	7.2%
	Zinc	7.5 J	12 J	AC

AC = Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution performed on sample location VOSS WELL(09122012) exhibited %D within the control limit.

8. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Alkalinity by SM 2320B	Water	14 days from collection to analysis	Cool to 4°C±2°C.
Ammonia-N by SM4500 NH ₃	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 9056 (Chloride, Fluoride, Sulfate, Bromide)	Water	28 days from collection to analysis	Cool to 4°C±2°C.
SW-846 9056 (Nitrate, Nitrite, Orthophosphate)	Water	48 hours from collection to analysis	Cool to 4°C±2°C.
Total Phosphorus by SM4500 P-E	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-1A(09122012) DUP-01(09122012)	Orthophosphate	Detected sample results <RL and <BAL	"UB" at the RL

RL = reporting limit

3. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

The correct number and type of standards were analyzed. The correlation coefficient of the initial calibration was greater than 0.995 and all initial calibration verification standard recoveries were within control limits.

All calibration standard recoveries were within the control limit.

4. Matrix Spike (MS)/Laboratory Duplicate Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

4.1 MS Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
VOSS WELL(09122012)	Orthophosphate	143%	160%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to the parent sample result associated with this SDG.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

4.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

The laboratory duplicate sample results exhibited RPD within the control limit.

5. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-1A(09122012)/ DUP-01(09122012)	Chloride	6.4	6.4	0.0 %
	Fluoride	0.05 J	0.046 J	AC
	Nitrate-N	1.9	1.9	0.0 %
	Orthophosphate	0.15 J	0.11 J	AC
	Sulfate	6.5	6.6	1.5 %
	Ammonia	0.046 J	0.036 J	AC
	Alkalinity	290	280	3.5 %

AC = Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

SULLIVAN, MISSOURI

Volatile Analyses

SDG #240-4572

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 19010R
Review Level: Tier III
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) 240-15149 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
					VOC	SVOC	PCB	MET	MISC
MW-107BH@390'(20111005)	240-4572-1	Water	10/5/2011		X				
MW-107BH@360'(20111005)	240-4572-2	Water	10/5/2011		X				
MW-107BH@340'(20111005)	240-4572-3	Water	10/5/2011		X				
MW-108BH@340'(20111005)	240-4572-4	Water	10/5/2011		X				
MW-108BH@370'(20111005)	240-4572-5	Water	10/5/2011		X				
MW-108BH@390'(20111005)	240-4572-6	Water	10/5/2011		X				
TB-01(20111005)	240-4572-7	Water	10/5/2011		X				

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-107BH@390'(20111005)	Hexachlorobutadiene Naphthalene 1,2,3-Trichlorobenzene 1,2,4-Trichlorobenzene	Detected sample results <RL and <BAL	"UB" at the RL

RL = reporting limit

3. Mass Spectrometer Tuning

Mass spectrometer performance was acceptable and all analyses were performed within a 12-hour tune clock.

System performance and column resolution were acceptable.

4. Calibration

Satisfactory instrument calibration is established to insure that the instrument is capable of producing acceptable quantitative data. An initial calibration demonstrates that the instrument is capable of acceptable performance at the beginning of an experimental sequence. The continuing calibration verifies that the instrument daily performance is satisfactory.

4.1 Initial Calibration

The method specifies percent relative standard deviation (%RSD) and relative response factor (RRF) limits for select compounds only. A technical review of the data applies limits to all compounds with no exceptions.

All target compounds associated with the initial calibration standards must exhibit a %RSD less than the control limit (15%) or a correlation coefficient greater than 0.99 and an RRF value greater than control limit (0.05).

4.2 Continuing Calibration

All target compounds associated with the continuing calibration standard must exhibit a percent difference (%D) less than the control limit (20%) and RRF value greater than control limit (0.05).

All compounds associated with the calibrations were within the specified control limits.

5. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

6. Internal Standard Performance

Internal standard performance criteria insure that the GC/MS sensitivity and response are stable during every sample analysis. The criteria requires the internal standard compounds associated with the VOC exhibit area counts that are not greater than two times (+100%) or less than one-half (-50%) of the area counts of the associated continuing calibration standard.

All internal standard responses were within control limits.

7. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD was not analyzed on a sample within this SDG.

8. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits.

The LCS analysis exhibited recoveries within the control limits.

9. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not analyzed on a sample within this SDG.

10. Compound Identification

Compounds are identified on the GC/MS by using the analytes relative retention time and ion spectra.

All identified compounds met the specified criteria.

Sample results associated with compound that exhibited a concentration greater than the linear range of the instrument calibration are summarized in the following table.

Sample ID	Compound	Original Analysis	Diluted Analysis	Reported Analysis
MW-108BH@340'(20111005)	Dichlorofluoromethane	--	79 D	79 D
MW-108BH@370'(20111005)	Dichlorofluoromethane	--	90 D	90 D
MW-108BH@390'(20111005)	Dichlorofluoromethane	--	100 D	100 D

Note: In the instance where both the original analysis and the diluted analysis sample results exhibited a concentration greater than and/or less than the calibration linear range of the instrument; the sample result exhibiting the greatest concentration will be reported as the final result.

Sample results associated with compounds exhibiting concentrations greater than the linear range are qualified as documented in the table below when reported as the final reported sample result.

Reported Sample Results	Qualification
Diluted sample result within calibration range	D
Diluted sample result less than the calibration range	DJ
Diluted sample result greater than the calibration range	EDJ
Original sample result greater than the calibration range	EJ

11. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Data Review

SULLIVAN, MISSOURI

Volatile Organic Compounds (VOCs), Metals, and
Miscellaneous Analyses.

SDG #s 240-12473, 240-12529, 240-12553, and
240-12605

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 19016R
Review Level: Tier II
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) 240-12473, 240-12529, 240-12553, and 240-12605 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis

Note: Miscellaneous analyses include alkalinity, orthophosphate, ammonia, bromide, chloride, sulfate, nitrite, nitrate, fluoride, and total phosphorus.

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is

that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260B	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Target compounds were detected in the associated QA blanks; however, the associated sample results were non-detect. Therefore, qualification of the sample results was not required.

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD analysis was not performed on a sample location within these SDGs.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The spiked compounds used in the LCS analysis must exhibit recoveries within the laboratory-established acceptance limits.

Sample locations associated with LCS analyses exhibiting recoveries outside of the control limits are presented in the following table.

Sample Location	Compound	LCS Recovery
TB(20120619) ER(20120620) MW-104(20120620) MW-108D(20120620) MW-108S(20120620)	Dibromomethane Dichlorodifluoromethane 1,2,3-Trichlorobenzene	> UL
MW-101(20120622) MW-1A(20120622)	1,1-Dichloroethane	> UL

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of any LCS deviations, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Field Duplicate Sample Analysis

The field duplicate sample analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the reporting limit (RL), a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results (in µg/L) for the field duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-105 (20120619) / DUP-1 (20120619)	1,1-Dichloroethane	2.8	2.8	0.0 %
	Chloroform	0.26 J	0.25 J	AC
	Dichlorodifluoromethane	1.4	1.2	15.4 %

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW-105 (20120619) / DUP-1 (20120619)	Dichloromonofluoromethane	40	35	13.3 %
	Tetrachloroethene	0.37 J	0.29 J	AC
	Trichloroethene	1.0	1.1	9.5 %
	Trichlorofluoromethane	7.6	6.9	9.7 %

AC Acceptable

J Estimated (result is < RL)

The field duplicate sample results are acceptable.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010, 6020, 2320B, 9056, SM4500 NH3, and SM4500 P-E. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

E The reported value is estimated due to the presence of interference.

N Spiked sample recovery is not within control limits.

* Duplicate analysis is not within control limits.

- Validation Qualifiers

J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

UB Analyte considered non-detect at the listed value due to associated blank contamination.

R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010, 6020	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Location	Analyte	Sample Result	Qualification
MW-107S (20120619) MW-1(20120621)	Manganese	Detected sample results <RL and <BAL	"UB" at the RL
MW-107D (20120618) MW-104(20120620)	Lithium Manganese		
MW-105 (20120619) MW-103(20120619) MW-1A(20120622)	Manganese Zinc		
DUP-1 (20120619) MW-102B(20120620) VOSSWELL(20120621)	Zinc		
MW-108D(20120620)	Lithium Zinc		
MW-102A(20120622)	Lithium		
MW-104(20120620) MW-108S(20120620) MW-101(20120622)	Zinc	Detected sample results > RL and < BAL	"UB" at detected sample concentration

RL = reporting limit

3. Matrix Spike (MS)/Laboratory Duplicate Sample Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS Analysis

All metal analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory flag will be removed.

The MS/MSD analysis was not performed on a sample location within these SDGs.

3.2 Laboratory Duplicate Sample Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the reporting limit (RL). A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of one times the RL is applied for water matrices and two times the RL for soil matrices.

The laboratory duplicate sample analysis was not performed on a sample location within these SDGs.

4. Field Duplicate Sample Analysis

The field duplicate sample analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID / Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-105 (20120619) / DUP-1 (20120619)	Barium	120 J	120 J	AC
	Boron	40 J	39 J	AC
	Calcium	72000	71000	1.4 %
	Lead	2.2 J	3.0 U	AC
	Magnesium	39000	38000	2.6 %
	Potassium	3300 J	3200 J	AC
	Silica	13000	13000	0.0 %
	Sodium	7600	7400	2.7 %
	Strontium	89	91	2.2 %

AC Acceptable

J Estimated (result is < RL)

U Not detected

The field duplicate sample results are acceptable.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution analysis was not performed on a sample location from within these SDGs.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Alkalinity by SM 2320B	Water	14 days from collection to analysis	Cool to 4°C \pm 2°C.
Ammonia-N by SM4500 NH ₃	Water	28 days from collection to analysis	Cool to 4°C \pm 2°C; preserved to a pH of less than 2.
SW-846 9056 (Chloride, Fluoride, Sulfate, Bromide)	Water	28 days from collection to analysis	Cool to 4°C \pm 2°C.
SW-846 9056 (Nitrate, Nitrite, Orthophosphate)	Water	48 hours from collection to analysis	Cool to 4°C \pm 2°C.
Total Phosphorus by SM4500 P-E	Water	28 days from collection to analysis	Cool to 4°C \pm 2°C; preserved to a pH of less than 2.

The analyses that exceeded the holding time are presented in the following table.

Sample Location	Analyte	Analysis Completed	HT Criteria
MW-101(20120622)	Nitrate-N Nitrite-N	75 Hours	48 Hours
	ortho-Phosphate	99 Hours	48 Hours
MW-1A(20120622)	Nitrate-N Nitrite-N	92 Hours	48 Hours
	ortho-Phosphate	117 Hours	48 Hours
MW-102A(20120622)	Nitrate-N Nitrite-N	73 Hours	48 Hours
	ortho-Phosphate	98 Hours	48 Hours

Sample results were qualified as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed < 2x holding time	J	UJ
Analysis completed > 2x holding time	J	R

Note: Due to the ready conversion of nitrite into nitrate, nitrate results for samples analyzed greater than 48 hours after collection should be considered as nitrate+nitrite. The sample results were qualified as outlined in the table above.

Similarly, ortho-phosphate readily converts to a more stable form and may only be detected as total phosphorus after 48 hours. In the instance where the total phosphorus result for a sample location was non-detect; the data were qualified as estimated regardless of the exceedance in the holding time.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Location	Analyte	Sample Result	Qualification
MW-107S (20120619) MW-107D (20120618) MW-1(20120621)	Chloride	Detected sample results > RL and < BAL	"UB" at detected sample concentration
MW-101(20120622) MW-102A(20120622)	Ammonia	Detected sample results <RL and <BAL	"UB" at the RL
MW-105 (20120619) MW-103(20120619) MW-104(20120620) MW-108D(20120620) MW-108S(20120620) MW-102B(20120620) VOSSWELL(20120621) MW-101(20120622) MW-102A(20120622)	ortho-Phosphate		

RL = reporting limit

3. Matrix Spike (MS)/Laboratory Duplicate Sample Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits.

Sample locations MW-105 (20120619), MW-108D(20120620), MW-101(20120622), and MW-1A(20120622) were used in the MS/MSD analyses. All analytes associated with MS recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery
-----------------	---------	----------------

Sample Location	Analyte	MS Recovery
MW-108D(20120620)	ortho-Phosphate	185 %
MW-101(20120622)	ortho-Phosphate	181 %

The criteria used to evaluate MS recoveries are presented in the following table. In the case of an MS deviation, the sample results are qualified.

Control limit	Sample Result	Qualification
MS percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS percent recovery < 30%	Non-detect	R
	Detect	J
MS percent recovery > 125%	Non-detect	No Action
	Detect	J

3.2 Laboratory Duplicate Sample Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the reporting limit (RL). A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of one times the RL is applied for water matrices and two times the RL for soil matrices.

All analytes associated with the laboratory duplicate sample results exhibited acceptable RPDs.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID / Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
MW-105 (20120619) / DUP-1 (20120619)	Bicarbonate Alkalinity	330	310	6.3 %
	Ammonia	0.043	0.20 U	AC
	Chloride	8.3	8.2	1.2 %
	Fluoride	0.015 J	0.020 J	AC
	Nitrate-N	1.8	1.7	5.7 %
	Sulfate	8.2	8.2	0.0 %

AC Acceptable

J Estimated (result is < RL)

U Not detected

The field duplicate sample results are acceptable.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All analytes associated with the LCS analyses exhibited recoveries within the control limits.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

SDGs #240-9083, 240-9136, 240-9209, and
240-9246

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 19034R
Review Level: Tier II
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) 240-9083, 240-9136, 240-9209, and 240-9246 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW107D(20120305)	Naphthalene 1,2,3-Trichlorobenzene	Detected sample results <RL and <BAL	"UB" at the RL
DUP(20120305)	Methylene chloride		

RL = reporting limit

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

An MS/MSD was not analyzed on a sample within this data set.

5. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the LCS/LCSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
MW-1 (20120313) TB-03 (20120313)	cis-1,3-Dichloropropene	>UL	-

AC = Acceptable

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW107S(20120305)/ DUP(20120305)	1,1,1-Trichloroethane	0.24 J	0.25 J	AC
	1,1-Dichloroethane	0.5 J	0.52 J	AC
	1,1-Dichloroethene	0.2 J	0.24 J	AC
	Chloroform	0.24 J	0.28 J	AC
	Dichlorodifluoromethane	3.1	3.2	3.1%
	Dichlorofluoromethane	67	65	3.0%
	Tetrachloroethene	0.42 J	0.41 J	AC
	Toluene	0.24 J	0.25 J	AC
	Trichloroethene	2.8	3	6.8%
	Trichlorofluoromethane	55	58	5.3%

AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. System Performance and Overall Assessment

Sample results associated with compound that exhibited a concentration greater than the linear range of the instrument calibration are summarized in the following table.

Sample ID	Compound	Original Analysis	Diluted Analysis	Reported Analysis
MW107S(20120305)	Dichlorofluoromethane	--	67 D	67 D
	Trichlorofluoromethane	--	55 D	55 D
DUP(20120305)	Dichlorofluoromethane	--	65 D	65 D
	Trichlorofluoromethane	--	58 D	58 D
MW108D(20120306)	Dichlorofluoromethane	--	96 D	96 D
	Trichlorofluoromethane	--	38 D	38 D
MW108S(20120306)	Dichlorofluoromethane	--	71 D	71 D
MW105(20120307)	Dichlorofluoromethane	--	45 D	45 D
MW103(20120308)	Dichlorofluoromethane	--	150 D	150 D
	Trichlorofluoromethane	--	130 D	130 D
MW-104(20120309)	Dichlorofluoromethane	--	51 D	51 D
VOSS(20120309)	Dichlorofluoromethane	--	68 D	68 D
	Trichlorofluoromethane	--	40 D	40 D

Note: In the instance where both the original analysis and the diluted analysis sample results exhibited a concentration greater than and/or less than the calibration linear range of the instrument; the sample result exhibiting the greatest concentration will be reported as the final result.

Sample results associated with compounds exhibiting concentrations greater than the linear range are qualified as documented in the table below when reported as the final reported sample result.

Reported Sample Results	Qualification
Diluted sample result within calibration range	D
Diluted sample result less than the calibration range	DJ
Diluted sample result greater than the calibration range	EDJ
Original sample result greater than the calibration range	EJ

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010, 2320B, 9056, SM4500 NH₃, and SM4500 P-E. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

- U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

- B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

- E The reported value is estimated due to the presence of interference.

- N Spiked sample recovery is not within control limits.

- * Duplicate analysis is not within control limits.

- Validation Qualifiers

- J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

- UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

- UB Analyte considered non-detect at the listed value due to associated blank contamination.

- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010B	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
DUP(20120305) MW103(20120308) MW-1 (20120313)	Potassium	Detected sample results <RL and <BAL	"UB" at the RL
MW103(20120308) MW-104(20120309) VOSS(20120309) MW-1A(20120314)	Manganese		
VOSS(20120309) MW-1A(20120314)	Zinc		
MW107S(20120305) MW105(20120307)	Boron		

RL = reporting limit

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

The MS/MSD analysis exhibited acceptable recoveries and RPD between recoveries.

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis. The MS/MSD recoveries exhibited acceptable RPD

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW107S(20120305)/ DUP(20120305)	Barium	60 J	58 J	AC
	Calcium	57000	56000	1.7%
	Lead	3	3.8	23.5%
	Magnesium	30000	29000	3.3%
	Manganese	1.5 J	1.6 J	AC
	Potassium	1100J	980J	AC
	SiO ₂ , Silica	9200	9200	0.0%
	Sodium	2500 J	2200 J	AC
	Zinc	740	720	2.7%
	Strontium	49	47	4.1%

AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution was not performed on a sample location within this SDG.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Alkalinity by SM 2320B	Water	14 days from collection to analysis	Cool to 4°C±2°C.
Ammonia-N by SM4500 NH ₃	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 9056 (Chloride, Fluoride, Sulfate, Bromide)	Water	28 days from collection to analysis	Cool to 4°C±2°C.
SW-846 9056 (Nitrate, Nitrite, Orthophosphate)	Water	48 hours from collection to analysis	Cool to 4°C±2°C.
Total Phosphorus by SM4500 P-E	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.

The analyses that exceeded the holding time are presented in the following table.

Sample Locations	Analyte	Holding Time	Criteria
MW107S(20120305) MW107D(20120305) DUP(20120305) MW108D(20120306) MW108S(20120306) MW102A(20120306)	Nitrate Nitrite Orthophosphate	>96 hours	<48 hours
MW102B(20120306) MW105(20120307) MW101(20120307)	Nitrate Nitrite Orthophosphate	>48 hours but <96 hours	<48 hours

Sample results associated with sample locations analyzed by analytical method SW-846 9056 were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

Note: Due to the ready conversion of nitrite into nitrate, nitrate results for samples analyzed greater than 48 hours after collection should be considered as nitrate+nitrite. The sample results were qualified as outlined in the table above.

Similarly, ortho-phosphate readily converts to a more stable form and may only be detected as total phosphorus after 48 hours. In the instance where the total phosphorus result for a sample location was non-detect; the data were qualified as estimated regardless of the exceedance in the holding time.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW107S(20120305) MW107D(20120305) MW108D(20120306) MW102A(20120306) MW102B(20120306) MW105(20120307) MW101(20120307) MW103(20120308)	Ammonia	Detected sample results <RL and <BAL	"UB" at the RL
MW107D(20120305) MW103(20120308)	Orthophosphate	Detected sample results >RL and <BAL	"UB" at detected sample concentration
MW108S(20120306) DUP(20120305)	Ammonia		

RL = reporting limit

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
MW107S(20120305)	Orthophosphate	>UL	--
MW105(20120307)	Orthophosphate	<10%	--
MW-1 (20120313)	Orthophosphate	>UL	--
MW-1A(20120314)	Fluoride	>UL	--

AC = Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified as documented in the table below.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

An MS/MSD was performed in replacement of the laboratory duplicate. All analytes associated with MS/MSD recoveries exhibited RPD within control limits.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
MW107S(20120305)/ DUP(20120305)	Alkalinity	250	240	4.0 %
	Chloride	2.8	2.9	3.5 %
	Fluoride	0.052 J	0.062 J	AC

Sample ID/Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
	Nitrate-N	0.68	0.71	4.3 %
	Sulfate	17	17	0.0 %

AC Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

5. Laboratory Control Sample (LCS)/Laboratory Control Sample Duplicate (LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%. The relative percent difference (RPD) between the LCS/LCSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

All LCS recoveries were within control limits.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA REPORTING QUALIFIERS

Client: TRW Automotive

Job Number: 240-9083-1

Lab Section	Qualifier	Description
GC/MS VOA		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry		
	B	Compound was found in the blank and sample.
	^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
	U	Indicates the analyte was analyzed for but not detected.
	*	LCS or LCSD exceeds the control limits
	F	MS or MSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	H	Sample was prepped or analyzed beyond the specified holding time

Data Review

SULLIVAN, MISSOURI

Volatile Organic Compounds (VOCs), Metals, and
Miscellaneous Analyses.

SDG #s 240-14977 and 240-15077

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 19038R
Review Level: Tier II
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) 240-14977 and 240-15077 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						VOC	SVOC	PCB	MET	MISC
240-14977	MW-108D (09102012)	240-14977-1	Water	9/10/2012		X			X	X
	TRIP BLANK	240-14977-2	Water	9/10/2012		X				
240-15077	MW-103 (09102012)	240-15077-1	Water	9/10/2012		X			X	X
	MW-108S (09112012)	240-15077-2	Water	9/11/2012		X			X	X
	MW-107S (09112012)	240-15077-3	Water	9/11/2012		X			X	X
	MW-107D (09112012)	240-15077-4	Water	9/11/2012		X			X	X
	TRIP BLANK_9/11/2012	240-15077-5	Water	9/11/2012		X				
	MW-102B (09112012)	240-15077-6	Water	9/11/2012		X			X	X
	MW-102A (09112012)	240-15077-7	Water	9/11/2012		X			X	X
	MW-1 (09122012)	240-15077-8	Water	9/12/2012		X			X	X
	TRIP BLANK_9/11/2012	240-15077-9	Water	9/11/2012		X				

Note: Miscellaneous analyses include alkalinity, orthophosphate, ammonia, bromide, chloride, sulfate, nitrite, nitrate, fluoride, and total phosphorus.

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is

that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260B	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Target compounds were detected in the associated QA blanks; however, the associated sample results were non-detect. Therefore, qualification of the sample results was not required.

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample location MW-103(09102012) was used in the MS/MSD analysis. All compounds associated with the MS/MSD analyses exhibited acceptable recoveries and RPDs between the MS and MSD results.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The spiked compounds used in the LCS analysis must exhibit recoveries within the laboratory-established acceptance limits.

All compounds associated with the LCS analysis exhibited recoveries within the control limits.

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the reporting limit (RL), a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Field duplicate samples were not collected as part of this dataset.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010, 6020, 2320B, 9056, SM4500 NH₃, and SM4500 P-E. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

- U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

- B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

- E The reported value is estimated due to the presence of interference.

- N Spiked sample recovery is not within control limits.

- * Duplicate analysis is not within control limits.

- Validation Qualifiers

- J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

- UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

- UB Analyte considered non-detect at the listed value due to associated blank contamination.

- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010, 6020	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Location	Analyte	Sample Result	Qualification
MW-108D(09102012)	Manganese	Detected sample results <RL and <BAL	"UB" at the RL

RL = reporting limit

3. Matrix Spike (MS)/Laboratory Duplicate Sample Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS Analysis

All metal analytes must exhibit recoveries within the established acceptance limits of 75% to 125%. The relative percent difference (RPD) between the MS and MSD results must be no greater than the established acceptance limit of 20%. The MS/MSD control limits do not apply for MS/MSDs performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD spiking concentration by a factor of four or greater. In instance where this is true, the data will not be qualified and the laboratory qualifier "N" will be removed. Sample results associated with MS/MSD

exceedances where the parent samples are not site-specific are not qualified.

Sample location MW-103(09102012) was used in the MS/MSD analyses. All analytes associated with the MS/MSD analyses exhibited acceptable recoveries and RPDs between the MS and MSD results.

3.2 Laboratory Duplicate Sample Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the reporting limit (RL). A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of one times the RL is applied for water matrices and two times the RL for soil matrices.

MS/MSD analysis was performed in lieu of the laboratory duplicate sample analysis. The MS/MSD exhibited acceptable RPDs.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Field duplicate samples were not collected as part of this dataset.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analyses exhibited recoveries within the control limits.

6. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution analysis was not performed on a sample location from within these SDGs.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Alkalinity by SM 2320B	Water	14 days from collection to analysis	Cool to 4°C±2°C.
Ammonia-N by SM4500 NH ₃	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 9056 (Chloride, Fluoride, Sulfate, Bromide)	Water	28 days from collection to analysis	Cool to 4°C±2°C.
SW-846 9056 (Nitrate, Nitrite, Orthophosphate)	Water	48 hours from collection to analysis	Cool to 4°C±2°C.
Total Phosphorus by SM4500 P-E	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.

The analyses that exceeded the holding time are presented in the following table.

Sample Location	Analyte	Analysis Completed	HT Criteria
MW-103(09102012)	Nitrate-N Nitrite-N ortho-Phosphate	68 Hours	48 Hours
MW-108S(09112012)	Nitrate-N Nitrite-N ortho-Phosphate	52 Hours	48 Hours
MW-107S(09112012)	Nitrate-N Nitrite-N ortho-Phosphate	49 Hours	48 Hours

Sample results were qualified as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed < 2x holding time	J	UJ

Note: Due to the ready conversion of nitrite into nitrate, nitrate results for samples analyzed greater than 48 hours after collection should be considered as nitrate+nitrite. Similarly, ortho-phosphate readily converts to a more stable form and may only be detected as total phosphorus after 48 hours. The total phosphorus results for the sample locations listed above were non-detect; therefore the ortho-phosphate results do not require qualification.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Target analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Matrix Spike (MS)/Laboratory Duplicate Sample Analysis

MS and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS recovery control limits do not apply for MS performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits.

Sample locations MW-103(09102012) and MW-102B(09112012) were used in the MS/MSD analyses. All analytes associated with MS recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery
MW-102B(09112012)	ortho-Phosphate	150 %

The criteria used to evaluate MS recoveries are presented in the following table. In the case of an MS deviation, the sample results are qualified.

Control limit	Sample Result	Qualification
MS percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS percent recovery < 30%	Non-detect	R
	Detect	J
MS percent recovery > 125%	Non-detect	No Action
	Detect	J

3.2 Laboratory Duplicate Sample Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the reporting limit (RL). A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of one times the RL is applied for water matrices and two times the RL for soil matrices.

All analytes associated with the laboratory duplicate sample results exhibited acceptable RPDs.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Field duplicate samples were not collected as part of this dataset.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All analytes associated with the LCS analyses exhibited recoveries within the control limits.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Miscellaneous Analyses.

SDG #s 240-18654, 240-18762, 240-18845, and
240-18953

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 19039R
Review Level: Tier II
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) 240-18654, 240-18762, 240-18845, and 240-18953 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

SDG	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						VOC	SVOC	PCB	MET	MISC
240-18654	MW-105 (20121210)	240-18654-1	Water	12/10/2012		X			X	X
	MW-101 (20121210)	240-18654-3	Water	12/11/2012		X				X
	TRIP BLANK	240-18654-4	Water	12/11/2012		X

11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is

that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260B	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2 s.u.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited concentrations less than the MDL, with the exception of the compound(s) listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Location	Analyte	Sample Result	Qualification
MW-107S(121212)	1,2,3-Trichlorobenzene	Detected sample results < RL and < BAL	"UB" at the RL
DUP-01(20121213)	Naphthalene		
	Methylene chloride		

RL Reporting limit

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

Sample location MW-107D(121212) was used in the MS/MSD analysis. Sample locations associated with the MS/MSD exhibiting recoveries outside of the control limits are presented in the following table.

Sample Location	Compound	MS Recovery	MSD Recovery
MW-107D(121212)	1,1,1-Trichloroethane	AC	< LL but > 10%

AC Acceptable

The criteria used to evaluate the MS/MSD recoveries are presented in the following table. In the case of MS/MSD deviations, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J
Parent sample concentration > 4x the MS/MSD spiking solution concentration.	Detect	No Action
	Non-detect	

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The spiked compounds used in the LCS analysis must exhibit recoveries within the laboratory-established acceptance limits.

Sample locations associated with LCS analyses exhibiting recoveries outside of the control limits are presented in the following table.

Sample Location	Compound	LCS Recovery
MW-107D(121212) TRIP BLANK MW-108D(121212)	1,3-Dichloropropane n-Propylbenzene 1,1,2,2-Tetrachloroethane 1,1,2-Trichloroethane 1,2,3-Trichloropropane	> UL

Sample Location	Compound	LCS Recovery
MW-1A(20121213) MW-102A(20121213) MW-102B(20121213) TRIP BLANK MW-108S(20121214) VOSS WELL(20121213) DUP-01(20121213) EB-01(20121213)	1,2,3-Trichlorobenzene	> UL

The criteria used to evaluate the LCS recoveries are presented in the following table. In the case of any LCS deviations, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results (in µg/L) for the field duplicate samples are summarized in the following table.

Sample ID / Duplicate ID	Compound	Sample Result	Duplicate Result	RPD
VOSS WELL(20121213) / DUP-01(20121213)	1,1,1-Trichloroethane	0.27 J	0.28 J	AC
	1,1-Dichloroethane	2.5	2.4	4.1 %
	1,1-Dichloroethene	0.32 J	0.28 J	AC
	Dichlorodifluoromethane	4.1	5.2	23.7 %
	Dichloromonofluoromethane	77	78	1.3 %
	Tetrachloroethene	0.94 J	0.88 J	AC
	Trichloroethene	1.8	1.7	5.7 %
	Trichlorofluoromethane	39	46	16.5 %

AC Acceptable

J Estimated (result is < RL)

The field duplicate sample results are acceptable.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010, 6020, 2320B, 9056, SM4500 NH₃, and SM4500 P-E. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

- U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.
- B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

- E The reported value is estimated due to the presence of interference.
- N Spiked sample recovery is not within control limits.
- * Duplicate analysis is not within control limits.

- Validation Qualifiers

- J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.
- UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.
- UB Analyte considered non-detect at the listed value due to associated blank contamination.
- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010, 6020	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Location	Analyte	Sample Result	Qualification
MW-107S(121212) MW-107D(121212) MW-101(20121213) MW-103(20121212) MW-1A(20121213) MW-102A(20121213) MW-102B(20121213) DUP-01(20121213)	Manganese	Detected sample results <RL and <BAL	"UB" at the RL
MW-101(20121213)	Barium Lithium		
MW-105(20121210) MW-108D(121212) MW-101(20121213)	Zinc		

RL = reporting limit

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Sample Analysis

MS/MSD and laboratory duplicate sample data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All metal analytes must exhibit recoveries within the established acceptance limits of 75% to 125%. The relative percent difference (RPD) between the MS and MSD results must be no greater than the established acceptance limit of 20%. The MS/MSD control limits do not apply for MS/MSDs performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD spiking concentration by a factor of four or greater. In instance where this is true, the data will not be qualified and the laboratory qualifier "N" will be removed. Sample results associated with MS/MSD exceedances where the parent samples are not site-specific are not qualified.

Sample location MW-107D(121212) was used in the MS/MSD analysis. All analytes associated with the MS/MSD analyses exhibited acceptable recoveries and RPDs between the MS and MSD results.

3.2 Laboratory Duplicate Sample Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the reporting limit (RL). A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of one times the RL is applied for water matrices and two times the RL for soil matrices.

MS/MSD analysis was performed in lieu of the laboratory duplicate sample analysis. The MS/MSD exhibited acceptable RPDs.

4. Field Duplicate Sample Analysis

The field duplicate sample analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID / Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
VOSS WELL(20121213) / DUP-01(20121213)	Barium	180 J	190 J	AC
	Calcium	46000	45000	2.2 %
	Magnesium	26000	26000	0.0 %
	Potassium	1100 J	1100 J	AC
	Sio2, silica	10000	10000	0.0 %
	Sodium	3800 J	3800 J	AC
	Zinc	8.5 J	8.0 J	AC
	Strontium	44	45	2.2 %

AC Acceptable

J Estimated (result is < RL)

The field duplicate sample results are acceptable.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analyses exhibited recoveries within the control limits.

6. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution analysis was not performed on a sample location from within these SDGs.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Alkalinity by SM 2320B	Water	14 days from collection to analysis	Cool to 4°C±2°C.
Ammonia-N by SM4500 NH ₃	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 9056 (Chloride, Fluoride, Sulfate, Bromide)	Water	28 days from collection to analysis	Cool to 4°C±2°C.
SW-846 9056 (Nitrate, Nitrite, Orthophosphate)	Water	48 hours from collection to analysis	Cool to 4°C±2°C.
Total Phosphorus by SM4500 P-E	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.

The analyses that exceeded the holding time are presented in the following table.

Sample Location	Analyte	Analysis Completed	HT Criteria
MW-103(20121212)	Nitrate-N Nitrite-N ortho-Phosphate	57 Hours	48 Hours
MW-103(20121212)	Nitrate-N Nitrite-N ortho-Phosphate	64 Hours	48 Hours

Sample results were qualified as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed < 2x holding time	J	UJ

Note: Due to the ready conversion of nitrite into nitrate, nitrate results for samples analyzed greater than 48 hours after collection should be considered as nitrate+nitrite. Similarly, ortho-phosphate readily converts to a more stable form and may only be detected as total phosphorus after 48 hours. The total phosphorus result for sample location MW-103(20121212) was non-detect; therefore the ortho-phosphate result does not require qualification.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks

containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Location	Analyte	Sample Result	Qualification
MW-105(20121210) MW-1(20121213) MW-101(20121213) MW-103(20121212) MW-1A(20121213) MW-102A(20121213) MW-102B(20121213) MW-108S(20121214) VOSS WELL(20121213) DUP-01(20121213)	Ammonia	Detected sample results <RL and <BAL	"UB" at the RL
MW-107S(121212) MW-107D(121212) MW-108D(121212) MW-1(20121213) MW-103(20121212) MW-1A(20121213) MW-102A(20121213) MW-102B(20121213) MW-108S(20121214) VOSS WELL(20121213) DUP-01(20121213)	Fluoride		

RL = reporting limit

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Sample Analysis

MS/MSD and laboratory duplicate sample data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit recoveries within the established acceptance limits of 75% to 125%. The relative percent difference (RPD) between the MS and MSD results must be no greater than the established acceptance limit of 20%. The MS/MSD control limits do not apply for MS/MSDs performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD spiking concentration by a factor of four or greater. In instance where this is true, the data will not be qualified. Sample results associated with MS/MSD exceedances where the parent samples are not site-specific are not qualified.

Sample locations MW-105(20121210), MW-104(20121211), MW-101(20121211), MW-107D(121212), MW-103(20121212), MW-101(20121213), MW-107S(20121214), and DUP-01(20121213) were used in the MS/MSD analyses. All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
MW-107D(121212)	ortho-Phosphate	150 %	140 %
MW-103(20121212)	ortho-Phosphate	148 %	---
MW-101(20121213)	Ammonia	142 %	135 %
MW-107S(20121214)	ortho-Phosphate	148 %	---

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery < 30%	Non-detect	R
	Detect	J
MS/MSD percent recovery > 125%	Non-detect	No Action
	Detect	J

3.2 Laboratory Duplicate Sample Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to five times the reporting limit (RL). A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of one times the RL is applied for water matrices and two times the RL for soil matrices.

All analytes associated with the laboratory duplicate sample results exhibited acceptable RPDs.

4. Field Duplicate Sample Analysis

The field duplicate sample analysis is used to assess the overall precision of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to five times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID / Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
VOSS WELL(20121213) / DUP-01(20121213)	Bicarbonate Alkalinity	210	230	9.1 %
	Chloride	7.6	7.8	2.6 %
	Fluoride	0.051 J	0.048 J	AC
	Nitrate-N	1.0	1.0	0.0 %
	Sulfate	11	11	0.0 %

AC Acceptable

J Estimated (result is < RL)

The field duplicate sample results are acceptable.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

All analytes associated with the LCS analyses exhibited recoveries within the control limits.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

SDGs #240-1297, 240-1920, 240-206,
240-2977, 240-3103, 240-3375, and 240-3479

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 19040R
Review Level: Tier II
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) 240-1297, 240-1920, 240-206, 240-2977, 240-3103, 240-3375, and 240-3479 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample Delivery Group	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						VOC	SVOC	PCB	MET	MISC
240-1297	MW-107 BH@185(20110617)	240-1297-1	Water	6/17/2011		X				
240-1920	MW-107BH@235'(20110711)	240-1920-1	Water	7/11/2011		X			X	X
	TRIP BLANK_7/11/2011	240-1920-2	Water	7/11/2011		X				
240-206	MW-107B4@97'(20110516)	240-206-1	Water	5/16/2011		X				
	TRIP BLANK(20110516)	240-206-2	Water	5/16/2011		X				
240-2977	MW-107BH@295'(20110817)	240-2977-1	Water	8/17/2011		X			X	X
	TRIP BLANK_8/17/2011	240-2977-2	Water	8/17/2011		X				
240-3103	MW-107BH@355'(20110822)	240-3103-1	Water	8/22/2011		X			X	X
	TRIP BLANK_8/22/2011	240-3103-2	Water	8/22/2011		X				
240-3375	MW-108BH@295'(20110829)	240-3375-1	Water	8/29/2011		X			X	X
	TRIP BLANK_8/29/2011	240-3375-2	Water	8/29/2011		X				
240-3479	MW-108BH@355'(20110831)	240-3479-1	Water	8/31/2011		X			X	X
	TRIP BLANK_8/31/2011	240-3479-2	Water	8/31/2011		X				

Note:

- Miscellaneous analyses include alkalinity, orthophosphate, ammonia, bromide, chloride, sulfate, nitrite, nitrate, fluoride, and total phosphorus.
- The matrix spike/matrix spike duplicates (MS/MSD) were performed on sample location MW-108BH@295'(20110829).

ANALYTICAL DATA PACKAGE DOCUMENTATION

12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. Therefore, sample results greater than the BAL resulted in the removal of the laboratory qualifier (J). No other qualification of the sample results was required.

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD exhibited recoveries and RPD within the control limit.

5. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the LCS/LCSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
MW-107 BH@185(20110617)	Trichlorofluoromethane	>UL	-

AC = Acceptable

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

A field duplicate was not analyzed on a sample within this data set.

6. System Performance and Overall Assessment

Sample results associated with compound that exhibited a concentration greater than the linear range of the instrument calibration are summarized in the following table.

Sample ID	Compound	Original Analysis	Diluted Analysis	Reported Analysis
MW-108BH@295'(20110829)	Dichlorofluoromethane	--	68 D	68 D
MW-108BH@355'(20110831)	Dichlorofluoromethane	--	50 D	68 D

Note: In the instance where both the original analysis and the diluted analysis sample results exhibited a concentration greater than and/or less than the calibration linear range of the instrument; the sample result exhibiting the greatest concentration will be reported as the final result.

Sample results associated with compounds exhibiting concentrations greater than the linear range are qualified as documented in the table below when reported as the final reported sample result.

Reported Sample Results	Qualification
Diluted sample result within calibration range	D
Diluted sample result less than the calibration range	DJ
Diluted sample result greater than the calibration range	EDJ
Original sample result greater than the calibration range	EJ

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010, 2320B, 9056, SM4500 NH₃, and SM4500 P-E. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

- U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

- B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

- E The reported value is estimated due to the presence of interference.

- N Spiked sample recovery is not within control limits.

- * Duplicate analysis is not within control limits.

- Validation Qualifiers

- J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

- UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

- UB Analyte considered non-detect at the listed value due to associated blank contamination.

- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010B	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-107BH@295'(20110817)	Manganese	Detected sample results <RL and <BAL	"UB" at the RL
MW-107BH@295'(20110817) MW-107BH@355'(20110822)	Zinc		

RL = reporting limit

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

In instance where this is true, the data will not be qualified even if the percent recovery does not meet the

control limits and the laboratory qualifier "N" will be removed.

The MS/MSD analysis exhibited acceptable recoveries and RPD between recoveries.

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis. The MS/MSD recoveries exhibited acceptable RPD

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not analyzed on a sample within this data set.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution was not performed on a sample location within this SDG.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Alkalinity by SM 2320B	Water	14 days from collection to analysis	Cool to 4°C±2°C.
Ammonia-N by SM4500 NH ₃	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 9056 (Chloride, Fluoride, Sulfate, Bromide)	Water	28 days from collection to analysis	Cool to 4°C±2°C.
SW-846 9056 (Nitrate, Nitrite, Orthophosphate)	Water	48 hours from collection to analysis	Cool to 4°C±2°C.
Total Phosphorus by SM4500 P-E	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.

The analyses that exceeded the holding time are presented in the following table.

Sample Locations	Analyte	Holding Time	Criteria
MW-108BH@355'(20110831)	Nitrate Nitrite Orthophosphate	>96 hours	<48 hours
MW-107BH@235'(20110711)		>48 hours but <96 hours	<48 hours

Sample results associated with sample locations analyzed by analytical method SW-846 9056 were qualified, as specified in the table below. All other holding times were met.

Criteria	Qualification	
	Detected Analytes	Non-detect Analytes
Analysis completed less than two times holding time	J	UJ
Analysis completed greater than two times holding time	J	R

Note: Due to the ready conversion of nitrite into nitrate, nitrate results for samples analyzed greater than 48 hours after collection should be considered as nitrate+nitrite. The sample results were qualified as outlined in the table above.

Similarly, ortho-phosphate readily converts to a more stable form and may only be detected as total phosphorus after 48 hours. In the instance where the total phosphorus result for a sample location was non-detect; the data were qualified as estimated regardless of the exceedance in the holding time.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All analytes associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the analytes listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (J) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW-108BH@355'(20110831) MW-107BH@355'(20110822)	Ammonia	Detected sample results <RL and <BAL	"UB" at the RL

RL = reporting limit

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits.

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

An MS/MSD was performed in replacement of the laboratory duplicate. All analytes associated with MS/MSD recoveries exhibited RPD within control limits.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not analyzed on a sample within this data set.

5. Laboratory Control Sample (LCS)/Laboratory Control Sample Duplicate (LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%. The relative percent difference (RPD) between the LCS/LCSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

All LCS recoveries were within control limits.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Data Review

SULLIVAN, MISSOURI

Volatile, Metals, and Misc. Analyses

SDG #A0K200424

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 19056R
Review Level: Tier II
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Group (SDG) A0K200424 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample Delivery Group	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						VOC	SVOC	PCB	MET	MISC
A0K200424	MW-108 BA@80' 20101119	A0K200424001	Soil	11/19/2010		X				
	TB-20101119	A0K200424002	Water	11/19/2010		X				

Note:

- 1 Sample MW-108 BA@80' 20101119 was evaluated as a solid due to a high amount of sediment present in the vials.

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD was not analyzed on a sample within this SDG.

5. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the LCS/LCSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

The LCS/LCSD exhibited recoveries within the control limit.

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

A field duplicate was not analyzed on a sample within this SDG.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

Volatile, Metals, and Misc. Analyses

SDGs #A0J140579 and A0J150505

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 19057R
Review Level: Tier II
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) A0J140579 and A0J150505 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample Delivery Group	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						VOC	SVOC	PCB	MET	MISC
A0J140579	SW-LJ01-20101013-0800	A0J140579-001	Water	10/13/2010		X			X	X
	SW-LJ03-20101013-0930	A0J140579-002	Water	10/13/2010		X			X	X
	EB01-20101013	A0J140579-003	Water	10/13/2010		X			X	X
	TB01-20101013	A0J140579-004	Water	10/13/2010		X

A0J150505	SW-FC01-20101014-0930	A0J150505-001	Water	10/14/2010		X				
	SW-FC02-20101014-1030	A0J150505-002	Water	10/14/2010		X				
	SW-FC03-20101014-1045	A0J150505-003	Water	10/14/2010		X				
	SW-CH01-20101013-1600	A0J150505-004	Water	10/13/2010		X				
	SW-TC01-20101013-1630	A0J150505-005	Water	10/13/2010		X				
	TB02-20101014	A0J150505-006	Water	10/14/2010		X				

Note:

- Miscellaneous analyses include alkalinity, orthophosphate, ammonia, bromide, chloride, sulfate, nitrite, nitrate, fluoride, and total phosphorus.
- The matrix spike/matrix spike duplicates (MS/MSD) were performed on sample location SW-LJ03-20101013-0930.

ANALYTICAL DATA PACKAGE DOCUMENTATION

The table below is the evaluation of the data package completeness.

Items Reviewed	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
1. Sample receipt condition		X		X	
2. Requested analyses and sample results		X		X	
3. Master tracking list		X		X	
4. Methods of analysis		X		X	
5. Reporting limits		X		X	
6. Sample collection date		X		X	
7. Laboratory sample received date		X		X	
8. Sample preservation verification (as applicable)		X		X	
9. Sample preparation/extraction/analysis dates		X		X	
10. Fully executed Chain-of-Custody (COC) form		X		X	
11. Narrative summary of QA or sample problems provided		X		X	
12. Data Package Completeness and Compliance		X		X	

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Compounds were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

The MS/MSD exhibited recoveries and RPD within the control limit.

5. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the LCS/LCSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
SW-FC01-20101014-0930 SW-FC02-20101014-1030 SW-FC03-20101014-1045 TB02-20101014	trans-1,2-Dichloroethene	<LL but >10%	AC
	trans-1,3-Dichloropropene	AC	>UL

AC = Acceptable

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-LJ01-20101013-0800/ SW-DUP-20101013	Trichloroethene	5.1	4.7	AC

AC = Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010, 2320B, 9056, SM4500 NH₃, and SM4500 P-E. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

- U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

- B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

- E The reported value is estimated due to the presence of interference.

- N Spiked sample recovery is not within control limits.

- * Duplicate analysis is not within control limits.

- Validation Qualifiers

- J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

- UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

- UB Analyte considered non-detect at the listed value due to associated blank contamination.

- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010B	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

The MS/MSD analysis exhibited acceptable recoveries and RPD between recoveries.

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis. The MS/MSD recoveries exhibited acceptable RPD

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-LJ01-20101013-0800/ SW-DUP-20101013	Calcium	38900	40500	4.0%
	Magnesium	21800	22700	4.0%
	Sodium	13200	13800	4.4%
	Strontium	58.4	62.1	6.1%
	Silica	10000	10200	2.0%

AC = Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

A serial dilution was not analyzed on a sample within this data set.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Alkalinity by SM 2320B	Water	14 days from collection to analysis	Cool to 4°C±2°C.
Ammonia-N by SM4500 NH3	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 9056 (Chloride, Fluoride, Sulfate, Bromide)	Water	28 days from collection to analysis	Cool to 4°C±2°C.
SW-846 9056 (Nitrate, Nitrite, Orthophosphate)	Water	48 hours from collection to analysis	Cool to 4°C±2°C.
Total Phosphorus by SM4500 P-E	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
SW-LJ03-20101013-0930	Orthophosphate	150%	149%

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to the parent sample result associated with this SDG.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

An MS/MSD was performed in replacement of the laboratory duplicate. All analytes associated with MS/MSD recoveries exhibited RPD within control limits.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

Results for duplicate samples are summarized in the following table.

Sample ID/Duplicate ID	Analyte	Sample Result	Duplicate Result	RPD
SW-LJ01-20101013-0800/ SW-DUP-20101013	Bicarbonate alkalinity	188	178	5.5%
	Chloride	15.9	14.4	9.9%
	Nitrate	1.6	1.6	0.0%
	Sulfate	12.9	12.8	0.8%

AC = Acceptable

The calculated RPDs between the parent sample and field duplicate were acceptable.

5. Laboratory Control Sample (LCS)/Laboratory Control Sample Duplicate (LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%. The relative percent difference (RPD) between the LCS/LCSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

All LCS recoveries were within control limits.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

DATA VALIDATION CHECKLIST FOR GENERAL CHEMISTRY

General Chemistry: EPA 1677	Reported		Performance Acceptable		Not Required
	No	Yes	No	Yes	
Miscellaneous Instrumentation					
Tier II Validation					
Holding times		X		X	
Reporting limits (units)		X		X	
Blanks					
A. Method blanks		X		X	
B. Equipment blanks					X
Laboratory Control Sample (LCS) %R		X		X	
Laboratory Control Sample Duplicate(LCSD) %R		X		X	
LCS/LCSD Precision (RPD)		X		X

Analyses Performed By:
TestAmerica Laboratories
North Canton, Ohio

Report: # 19063R
Review Level: Tier II
Project: KC001590.0003.00008

SUMMARY

This data quality assessment summarizes the review of Sample Delivery Groups (SDGs) A0K160507, A0K190517, A0L030505, A0L170577, A1C170433, and A1D270430 for samples collected in association with the Oak Grove Village Site. The review was conducted as a Tier II evaluation and included review of data package completeness. Only analytical data associated with constituents of concern were reviewed for this validation. Field documentation was not included in this review. Included with this assessment are the validation annotated sample result sheets, and chain of custody. Analyses were performed on the following samples:

Sample Delivery Group	Sample ID	Lab ID	Matrix	Sample Collection Date	Parent Sample	Analysis				
						VOC	SVOC	PCB	MET	MISC
A0K160507	MW-108 BH@26'-20101112	A0K160507001	Water	11/12/2010		X

QA - Quality Assurance

ORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) Method 8260B. Data were reviewed in accordance with USEPA National Functional Guidelines of October 1999.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and had already been subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with USEPA National Functional Guidelines:

- Concentration (C) Qualifiers
 - U The compound was analyzed for but not detected. The associated value is the compound quantitation limit.
 - B The compound has been found in the sample as well as its associated blank, its presence in the sample may be suspect.
- Quantitation (Q) Qualifiers
 - E The compound was quantitated above the calibration range.
 - D Concentration is based on a diluted sample analysis.
- Validation Qualifiers
 - J The compound was positively identified; however, the associated numerical value is an estimated concentration only.
 - UJ The compound was not detected above the reported sample quantitation limit. However, the reported limit is approximate and may or may not represent the actual limit of quantitation.
 - JN The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification. The associated numerical value is an estimated concentration only.
 - UB Compound considered non-detect at the listed value due to associated blank contamination.
 - N The analysis indicates the presence of a compound for which there is presumptive evidence to make a tentative identification.
 - R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

VOLATILE ORGANIC COMPOUND (VOC) ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 8260	Water	14 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	48 hours from collection to extraction and 14 days from extraction to analysis	Cool to 4°C±2°C.

s.u. Standard units

All samples were analyzed within the specified holding time criteria.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

All compounds associated with the QA blanks exhibited a concentration less than the MDL, with the exception of the compounds listed in the following table. Sample results associated with QA blank contamination that were greater than the BAL resulted in the removal of the laboratory qualifier (B) of data. Sample results less than the BAL associated with the following sample locations were qualified as listed in the following table.

Sample Locations	Analytes	Sample Result	Qualification
MW108(187-235)(20110316)	1,2,4-Trimethylbenzene 1,3,5-Trimethylbenzene	Detected sample results <RL and <BAL	"UB" at the RL
MW-107BH@16'(20110426)	Naphthalene		

RL Reporting limit

3. Surrogates/System Monitoring Compounds

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits.

All surrogate recoveries were within control limits.

4. Matrix Spike/Matrix Spike Duplicate (MS/MSD) Analysis

MS/MSD data are used to assess the precision and accuracy of the analytical method. The compounds used to perform the MS/MSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Note: The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the compound concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

An MS/MSD was not analyzed on a sample within this data set.

5. Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS/LCSD analysis must exhibit a percent recovery within the laboratory-established acceptance limits. The relative percent difference (RPD) between the LCS/LCSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

Sample locations associated with LCS/LCSD analysis exhibiting recoveries outside of the control limits presented in the following table.

Sample Locations	Compound	LCS Recovery	LCSD Recovery
MW-108 POTABLE-20101118 TB-20101118	Bromomethane	<LL but >10%	AC
MW-108 BH@141'-20101201	Bromodichloromethane	>UL	-
	1,2-Dichloroethane	>UL	-

AC = Acceptable

The criteria used to evaluate the LCS/LCSD recoveries are presented in the following table. In the case of an LCS/LCSD deviation, the sample results are qualified as documented in the table below.

Control Limit	Sample Result	Qualification
> the upper control limit (UL)	Non-detect	No Action
	Detect	J
< the lower control limit (LL) but > 10%	Non-detect	UJ
	Detect	J
< 10%	Non-detect	R
	Detect	J

6. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices is applied to the RPD between the parent

sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices.

A field duplicate was not analyzed on a sample within this data set.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

INORGANIC ANALYSIS INTRODUCTION

Analyses were performed according to United States Environmental Protection Agency (USEPA) SW-846 Methods 6010, 2320B, 9056, SM4500 NH₃, and SM4500 P-E. Data were reviewed in accordance with USEPA National Functional Guidelines of July 2002.

The data review process is an evaluation of data on a technical basis rather than a determination of contract compliance. As such, the standards against which the data are being weighed may differ from those specified in the analytical method. It is assumed that the data package represents the best efforts of the laboratory and that it was already subjected to adequate and sufficient quality review prior to submission.

During the review process, laboratory qualified and unqualified data are verified against the supporting documentation. Based on this evaluation, qualifier codes may be added, deleted, or modified by the data reviewer. Results are qualified with the following codes in accordance with the USEPA National Functional Guidelines:

- Concentration (C) Qualifiers

- U The analyte was analyzed for but not detected. The associated value is the analyte instrument detection limit.

- B The reported value was obtained from a reading less than the contract-required detection limit (CRDL), but greater than or equal to the instrument detection limit (IDL).

- Quantitation (Q) Qualifiers

- E The reported value is estimated due to the presence of interference.

- N Spiked sample recovery is not within control limits.

- * Duplicate analysis is not within control limits.

- Validation Qualifiers

- J The analyte was positively identified; however, the associated numerical value is an estimated concentration only.

- UJ The analyte was not detected above the reported sample detection limit. However, the reported limit is approximate and may or may not represent the actual limit of detection.

- UB Analyte considered non-detect at the listed value due to associated blank contamination.

- R The sample results are rejected.

Two facts should be noted by all data users. First, the "R" flag means that the associated value is unusable. In other words, due to significant quality control (QC) problems, the analysis is invalid and provides no information as to whether the compound is present or not. "R" values should not appear on data tables because they cannot be relied upon, even as a last resort. The second fact to keep in mind is that no compound concentration, even if it has passed all QC tests, is guaranteed to be accurate. Strict QC serves to increase confidence in data but any value potentially contains error.

METALS ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
SW-846 6010B	Water	180 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
	Soil	180 days from collection to analysis	Cool to 4°C±2°C.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were detected in the associated QA blanks; however, the associated sample results were greater than the BAL and/or were non-detect. Therefore, sample results greater than the BAL resulted in the removal of the laboratory qualifier (J). No other qualification of the sample results was required.

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater.

In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

The MS/MSD analysis exhibited acceptable recoveries and RPD between recoveries.

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times

the CRDL is applied for water matrices and two times the CRDL for soil matrices.

MS/MSD analysis was performed in replacement of the laboratory duplicate analysis. The MS/MSD recoveries exhibited acceptable RPD

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not analyzed on a sample within this data set.

5. Laboratory Control Sample (LCS) Analysis

The LCS analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS analysis must exhibit a percent recovery between the control limits of 80% and 120%.

The LCS analysis exhibited recoveries within the control limits.

6. Serial Dilution

The serial dilution analysis is used to assess if a significant physical or chemical interference exists due to sample matrix. Analytes exhibiting concentrations greater than 50 times the MDL in the undiluted sample are evaluated to determine if matrix interference exists. These analytes are required to have less than a 10% difference (%D) between sample results from the undiluted (parent) sample and results associated with the same sample analyzed with a five-fold dilution.

The serial dilution was not performed on a sample location within this SDG.

7. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

GENERAL CHEMISTRY ANALYSES

1. Holding Times

The specified holding times for the following methods are presented in the following table.

Method	Matrix	Holding Time	Preservation
Alkalinity by SM 2320B	Water	14 days from collection to analysis	Cool to 4°C±2°C.
Ammonia-N by SM4500 NH3	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.
SW-846 9056 (Chloride, Fluoride, Sulfate, Bromide)	Water	28 days from collection to analysis	Cool to 4°C±2°C.
SW-846 9056 (Nitrate, Nitrite, Orthophosphate)	Water	48 hours from collection to analysis	Cool to 4°C±2°C.
Total Phosphorus by SM4500 P-E	Water	28 days from collection to analysis	Cool to 4°C±2°C; preserved to a pH of less than 2.

All samples were analyzed within the specified holding times.

2. Blank Contamination

Quality assurance (QA) blanks (i.e., method and rinse blanks) are prepared to identify any contamination which may have been introduced into the samples during sample preparation or field activity. Method blanks measure laboratory contamination. Rinse blanks measure contamination of samples during field operations.

A blank action level (BAL) of five times the concentration of a detected compound in an associated blank (common laboratory contaminant compounds are calculated at ten times) is calculated for QA blanks containing concentrations greater than the method detection limit (MDL). The BAL is compared to the associated sample results to determine the appropriate qualification of the sample results, if needed.

Analytes were not detected above the MDL in the associated blanks; therefore detected sample results were not associated with blank contamination.

3. Matrix Spike/Matrix Spike Duplicate (MS/MSD)/Laboratory Duplicate Analysis

MS/MSD and laboratory duplicate data are used to assess the precision and accuracy of the analytical method.

3.1 MS/MSD Analysis

All analytes must exhibit a percent recovery within the established acceptance limits of 75% to 125%. The MS/MSD recovery control limits do not apply for MS/MSD performed on sample locations where the analyte's concentration detected in the parent sample exceeds the MS/MSD concentration by a factor of four or greater. In instance where this is true, the data will not be qualified even if the percent recovery does not meet the control limits and the laboratory qualifier "N" will be removed.

All analytes associated with MS/MSD recoveries were within control limits with the exception of the following analyte present in the table below.

Sample Location	Analyte	MS Recovery	MSD Recovery
MW108(187-235)(20110316)	Orthophosphate	217%	-
	Chloride	131%	-

The criteria used to evaluate MS/MSD recoveries are presented in the following table. In the case of an MS/MSD deviation, the sample results are qualified. The qualifications are applied to the parent sample result associated with this SDG.

Control limit	Sample Result	Qualification
MS/MSD percent recovery 30% to 74%	Non-detect	UJ
	Detect	J
MS/MSD percent recovery <30%	Non-detect	R
	Detect	J
MS/MSD percent recovery >125%	Non-detect	No Action
	Detect	J

3.2 Laboratory Duplicate Analysis

The laboratory duplicate relative percent difference (RPD) criterion is applied when parent and duplicate sample concentrations are greater than or equal to 5 times the CRDL. A control limit of 20% for water matrices and 35% for soil matrices is applied when the criteria above is true. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the CRDL, a control limit of one times the CRDL is applied for water matrices and two times the CRDL for soil matrices.

An MS/MSD was performed in replacement of the laboratory duplicate. All analytes associated with MS/MSD recoveries exhibited RPD within control limits.

4. Field Duplicate Analysis

Field duplicate analysis is used to assess the precision and accuracy of the field sampling procedures and analytical method. A control limit of 40% for water matrices and 70% for soil matrices is applied to the RPD between the parent sample and the field duplicate. In the instance when the parent and/or duplicate sample concentrations are less than or equal to 5 times the RL, a control limit of two times the RL is applied for water matrices or three times the RL is applied for soil matrices.

A field duplicate was not analyzed on a sample within this data set.

5. Laboratory Control Sample (LCS)/Laboratory Control Sample Duplicate (LCSD) Analysis

The LCS/LCSD analysis is used to assess the precision and accuracy of the analytical method independent of matrix interferences. The analytes associated with the LCS/LCSD analysis must exhibit a percent recovery between the control limits of 80% and 120%. The relative percent difference (RPD) between the LCS/LCSD recoveries must exhibit an RPD within the laboratory-established acceptance limits.

All LCS recoveries were within control limits.

6. System Performance and Overall Assessment

Overall system performance was acceptable. Other than for those deviations specifically mentioned in this review, the overall data quality is within the guidelines specified in the method.

CASE NARRATIVE

CASE NARRATIVE

A1D270430

The following report contains the analytical results for one water sample submitted to TestAmerica North Canton by TRW Automotive Inc. from the OAK GROVE VILLAGE, MO Site, project number KC001590.0003.00002. The sample was received April 27, 2011, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The sample presented in this report was analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. Preliminary results were provided to John Shonfelt and Larry Benolkin on May 16, 2011. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the method detection limit and include qualified results where applicable.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 1.6°C.

GC/MS VOLATILES

The sample(s) that contained concentrations of target analyte(s) at a reportable level in the associated Method Blank(s) were flagged with "B". All target analytes in the Method Blank must be below the reporting limit (RL) or the associated sample(s) must be ND with the exception of common laboratory contaminants.

The sample(s) that contain results between the MDL and the RL were flagged with "J". There is a possibility of false positive or mis-identification at these quantitation levels. In analytical methods requiring confirmation of the analyte reported, confirmation was performed only down to the standard reporting limit (SRL). The acceptance criteria for QC samples may not be met at these quantitation levels.

The matrix spike/matrix spike duplicate(s) for batch(es) 1125148 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called Quality Control Batches (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a Method Blank (MB), a Laboratory Control Sample (LCS) and, a Matrix Spike/Matrix Spike Duplicate (MS/MSD) pair or a Matrix Spike/Sample Duplicate (MS/DU) pair.

For 600 series/CWA methods, QC samples include a Method Blank (MB), a Laboratory Control Sample (LCS) and, where appropriate, a Matrix Spike (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. Failure to meet the established recovery guidelines requires the reparation and reanalysis of all samples in the QC batch, with the exception of poor performing analytes. A list of these analytes is listed below. No corrective action is taken if these analytes do not meet criteria. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

Poor performers

Method 8270 Water and Solid:	
4-Nitrophenol	3,3' - Dichlorobenzidine
Benzoic Acid	2,4,6 - Tribromophenol
Phenol	2,4-Dinitrophenol
Phenol-d5	Pentachlorophenol
4,6-Dinitro-2-methylphenol	Hexachlorocyclopentadiene (LCG only)
Benzyl Alcohol	4-Chloroaniline
Method 8151 Solid	
Dinoseb	
Method 8260 Water and Solid	
Dichlorodifluoromethane	Hexachlorobutadiene
Trichlorofluoromethane	Naphthalene
Chloroethane	1,2,3-Trichlorobenzene
Acetone	1,2,4-Trichlorobenzene
Bromomethane	2,2-Dichloropropane
Bromoform	Chloromethane

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be ten fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

QUALITY CONTROL ELEMENTS NARRATIVE (continued)

<u>Volatile (GC or GC/MS)</u>	<u>Semivolatile (GC/MS)</u>	<u>Metals ICP-MS</u>	<u>Metals ICP Trace</u>
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.
- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the reparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results do not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate or Matrix Spike/Sample Duplicate.

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater. For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),

Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada (#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190), DoD ELAP (ADE-1437) USDA Soil Permit (P33-08-00123)

NOTE(S) :

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

CASE NARRATIVE

Client: TRW Automotive

Project: TRW OGV OU2 Sullivan, MO

Report Number: 240-1920-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 07/13/2011; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 2.6 C.

Method(s) 9056A: The following samples were prepared outside of preparation holding time: MW-107BH@235'(20110711).

All other samples were received in good condition within temperature requirements.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MW-107BH@235'(20110711) (240-1920-1) and TRIP BLANK (240-1920-2) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 07/18/2011.

No difficulties were encountered during the volatiles analyses.

All quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICP)

Sample MW-107BH@235'(20110711) (240-1920-1) was analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were analyzed on 07/19/2011, 07/20/2011 and 08/03/2011.

Barium, Calcium and Potassium were detected in method blank MB 240-8571/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

Manganese failed the recovery criteria low for the MS/MSD of sample 240-1929-2 in batch 240-9023.

Refer to the QC report for details.

No other difficulties were encountered during the metals analysis.

All other quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICPMS)

Sample MW-107BH@235'(20110711) (240-1920-1) was analyzed for dissolved metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were analyzed on 08/03/2011.

No difficulties were encountered during the metals analysis.

All quality control parameters were within the acceptance limits.

ALKALINITY

Sample MW-107BH@235'(20110711) (240-1920-1) was analyzed for alkalinity in accordance with SM20 2320B. The samples were analyzed on 07/14/2011.

Alkalinity was detected in method blank MB 240-8495/5 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J".

No other difficulties were encountered during the alkalinity analysis.

All other quality control parameters were within the acceptance limits.

DISSOLVED PHOSPHORUS

Sample MW-107BH@235'(20110711) (240-1920-1) was analyzed for Dissolved Phosphorus in accordance with SM4500 P E. The samples were analyzed on 07/15/2011.

No difficulties were encountered during the Total Phosphorus analysis.

All quality control parameters were within the acceptance limits.

ANIONS

Sample MW-107BH@235'(20110711) (240-1920-1) was analyzed for anions in accordance with EPA SW-846 Method 9056A. The samples were analyzed on 07/14/2011.

Orthophosphate failed the recovery criteria high for the MS/MSD of sample 240-1930-5 in batch 240-8356.

Refer to the QC report for details.

No difficulties were encountered during the anions analysis.

All other quality control parameters were within the acceptance limits.

ANIONS

Sample MW-107BH@235'(20110711) (240-1920-1) was analyzed for anions in accordance with EPA SW-846 Method 9056A. The samples were analyzed on 07/14/2011.

Chloride failed the recovery criteria high for the MSD of sample 240-1930-5 in batch 240-8357.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

No other difficulties were encountered during the anions analysis.

All other quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: TRW Automotive

Job Number: 240-1920-1

Lab Section	Qualifier	Description
GC/MS VOA		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals		
	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry		
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
	H	Sample was prepped or analyzed beyond the specified holding time

Revised

The following report contains the analytical results for one water sample and one quality control sample submitted to TestAmerica North Canton by TRW Automotive Inc. from the TRW OGV Site, project number KC001590.0003.00002. The samples were received November 13, 2010, according to documented sample acceptance procedures.

Revised report includes sample id change. Per client sample id MW-3 BH@26' - 20101112 listed on chain of custody should be MW-108 BH@26' 20101112.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the reporting limit.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 2.2°C.

GC/MS VOLATILES

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the reparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

<u>Volatile (GC or GC/MS)</u>	<u>Semivolatile (GC/MS)</u>	<u>Metals ICP-MS</u>	<u>Metals ICP Trace</u>
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

QUALITY CONTROL ELEMENTS NARRATIVE (continued)

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.
- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the reparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),
Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada
(#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190), NAVY,
ARMY, USDA Soil Permit

NOTE(S) :

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

CASE NARRATIVE

CASE NARRATIVE

A0K160527

The following report contains the analytical results for one solid sample submitted to TestAmerica North Canton by TRW Automotive Inc. from the TRW OGV Site. The sample was received November 12, 2010, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The sample presented in this report was analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by a dry weight adjustment footnote at the bottom of the analytical report page. The list of parameters which are never reported on a dry weight basis is included on the Sample Summary.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the reporting limit.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 3.6°C.

GC/MS VOLATILES

Result concentration exceeds the calibration range. Refer to the sample report pages for the affected compound(s) flagged with "E".

The matrix spike/matrix spike duplicate(s) for IDW SOIL-20101111 had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

The matrix spike/matrix spike duplicate(s) for batch(es) 0326427 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

METALS

The matrix spike/matrix spike duplicate(s) for batch(es) 0321019 had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

No ICP Trace Form IX provided for batch(es)0321019. The serial dilution was performed on a different sample from the same QC batch(es).

GENERAL CHEMISTRY

The analytical results met the requirements of the laboratory's QA/QC program.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the reparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

<u>Volatile (GC or GC/MS)</u>	<u>Semivolatile (GC/MS)</u>	<u>Metals ICP-MS</u>	<u>Metals ICP Trace</u>
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

QUALITY CONTROL ELEMENTS NARRATIVE (continued)

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.
- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the reparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),
Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada
(#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190), NAVY,

CASE NARRATIVE

CASE NARRATIVE

A0K190517

Revised

The following report contains the analytical results for one water sample and one quality control sample submitted to TestAmerica North Canton by TRW Automotive Inc. from the OGV OU2 Site, project number KC001590.0003.00002. The samples were received November 19, 2010, according to documented sample acceptance procedures.

Revised report includes sample id change. Per client sample id MW-3 POTABLE listed on chain of custody should be MW-108 POTABLE-20101118.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the reporting limit.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 2.7°C.

GC/MS VOLATILES

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the reparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

<u>Volatile (GC or GC/MS)</u>	<u>Semivolatile (GC/MS)</u>	<u>Metals ICP-MS</u>	<u>Metals ICP Trace</u>
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

QUALITY CONTROL ELEMENTS NARRATIVE (continued)

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.
- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the reparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),
Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada
(#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190), NAVY,
ARMY, USDA Soil Permit

CASE NARRATIVE

CASE NARRATIVE

A0K200424

Revised

The following report contains the analytical results for one solid sample and one quality control sample submitted to TestAmerica North Canton by TRW Automotive Inc. from the TRW OGVOU2 Site. The samples were received November 20, 2010, according to documented sample acceptance procedures.

Revised report includes sample id change. Per client sample id MW-3 BA@ 80' 20101119 listed on chain of custody should be MW-108 BH@80' 20101119.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by a dry weight adjustment footnote at the bottom of the analytical report page. The list of parameters which are never reported on a dry weight basis is included on the Sample Summary.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the reporting limit.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 1.8°C.

See TestAmerica's Cooler Receipt Form for additional information.

GC/MS VOLATILES

The matrix spike/matrix spike duplicate(s) for batch(es) 0337316 had recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

GENERAL CHEMISTRY

The analytical results met the requirements of the laboratory's QA/QC program.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the reparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

<u>Volatile (GC or GC/MS)</u>	<u>Semivolatile (GC/MS)</u>	<u>Metals ICP-MS</u>	<u>Metals ICP Trace</u>
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

QUALITY CONTROL ELEMENTS NARRATIVE (continued)

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.
- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the reparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),
Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada
(#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190), NAVY,
ARMY, USDA Soil Permit

CASE NARRATIVE

CASE NARRATIVE

A0L030505

Revised

The following report contains the analytical results for one water sample and one quality control sample submitted to TestAmerica North Canton by TRW Automotive Inc. from the TRW OGV/KC001590.0003.00002 Site. The samples were received December 02, 2010, according to documented sample acceptance procedures.

Revised report includes sample id change. Per client sample id MW-3 BH@141'-20101201 listed on chain of custody should be MW-108 BH@141' 20101201.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the reporting limit.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 1.5°C.

GC/MS VOLATILES

The matrix spike/matrix spike duplicate(s) for batch(es) 0342122 and 0344198 had RPD's and recoveries outside acceptance limits. However, since the associated method blank(s) and laboratory control sample(s) were in control, no corrective action was necessary.

2-Chloroethyl vinyl ether cannot be reliably recovered in an acid preserved sample.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the reparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

<u>Volatile (GC or GC/MS)</u>	<u>Semivolatile (GC/MS)</u>	<u>Metals ICP-MS</u>	<u>Metals ICP Trace</u>
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

QUALITY CONTROL ELEMENTS NARRATIVE (continued)

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.
- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the reparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),
Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada
(#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190), NAVY,
ARMY, USDA Soil Permit

NOTE(S) :

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

CASE NARRATIVE

CASE NARRATIVE

A0L170577

Revised

The following report contains the analytical results for one water sample and one quality control sample submitted to TestAmerica North Canton by TRW Automotive Inc. from the TRW OGV2 Site. The samples were received December 17, 2010, according to documented sample acceptance procedures.

Revised report includes sample id change. Per client sample id MW-3BH@185'20101115 listed on chain of custody should be MW-108 BH@185'20101215.

TestAmerica utilizes USEPA approved methods in all analytical work. The samples presented in this report were analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the reporting limit.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 2.2°C.

GC/MS VOLATILES

The analytical results met the requirements of the laboratory's QA/QC program.

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the reparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

<u>Volatile (GC or GC/MS)</u>	<u>Semivolatile (GC/MS)</u>	<u>Metals ICP-MS</u>	<u>Metals ICP Trace</u>
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

QUALITY CONTROL ELEMENTS NARRATIVE (continued)

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.
- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the reparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),
Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada
(#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190), NAVY,
ARMY, USDA Soil Permit

CASE NARRATIVE

CASE NARRATIVE

A0L230533

The following report contains the analytical results for one solid sample submitted to TestAmerica North Canton by TRW Automotive Inc. from the TRW OGV OU2 Site, project number KC001590.0003.00002. The sample was received December 23, 2010, according to documented sample acceptance procedures.

TestAmerica utilizes USEPA approved methods in all analytical work. The sample presented in this report was analyzed for the parameter(s) listed on the analytical methods summary page in accordance with the method(s) indicated. A summary of QC data for these analyses is included at the back of the report.

TestAmerica North Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the applicable methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by a dry weight adjustment footnote at the bottom of the analytical report page. The list of parameters which are never reported on a dry weight basis is included on the Sample Summary.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory. This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

All parameters were evaluated to the reporting limit.

Please refer to the Quality Control Elements Narrative following this case narrative for additional quality control information.

If you have any questions, please call the Project Manager, Denise Pohl, at 330-497-9396.

This report is sequentially paginated. The final page of the report is labeled as "END OF REPORT."

CASE NARRATIVE (continued)

SUPPLEMENTAL QC INFORMATION

SAMPLE RECEIVING

The temperature of the cooler upon sample receipt was 2.9°C.

METALS

No ICP Trace Form IX was provided for batch(es) 0363112. The serial dilution was performed on a different sample from the same QC batch(es).

QUALITY CONTROL ELEMENTS NARRATIVE

TestAmerica conducts a quality assurance/quality control (QA/QC) program designed to provide scientifically valid and legally defensible data. Toward this end, several types of quality control indicators are incorporated into the QA/QC program, which is described in detail in QA Policy, QA-003. These indicators are introduced into the sample testing process to provide a mechanism for the assessment of the analytical data. Program or agency specific requirements take precedence over the requirements listed in this narrative.

QC BATCH

Environmental samples are taken through the testing process in groups called QUALITY CONTROL BATCHES (QC batches). A QC batch contains up to twenty environmental samples of a similar matrix (water, soil) that are processed using the same reagents and standards. TestAmerica North Canton requires that each environmental sample be associated with a QC batch.

Several quality control samples are included in each QC batch and are processed identically to the twenty environmental samples.

For SW846/RCRA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) pair or a MATRIX SPIKE/SAMPLE DUPLICATE (MS/DU) pair. If there is insufficient sample to perform an MS/MSD or an MS/DU, then a LABORATORY CONTROL SAMPLE DUPLICATE (LCSD) is included in the QC batch.

For 600 series/CWA methods, QC samples include a METHOD BLANK (MB), a LABORATORY CONTROL SAMPLE (LCS) and, where appropriate, a MATRIX SPIKE (MS). An MS is prepared and analyzed at a 10% frequency for GC Methods and at a 5% frequency for GC/MS methods.

LABORATORY CONTROL SAMPLE

The Laboratory Control Sample is a QC sample that is created by adding known concentrations of a full or partial set of target analytes to a matrix similar to that of the environmental samples in the QC batch. Multi peak responders may not be included in the target spike list due to co-elution. The LCS analyte recovery results are used to monitor the analytical process and provide evidence that the laboratory is performing the method within acceptable guidelines. All control analytes indicated by a bold type in the LCS must meet acceptance criteria. Failure to meet the established recovery guidelines requires the reparation and reanalysis of all samples in the QC batch. Comparison of only the failed parameters from the first batch are evaluated. The only exception to the rework requirement is that if the LCS recoveries are biased high and the associated sample is ND (non-detected) for the parameter(s) of interest, the batch is acceptable.

At times, a Laboratory Control Sample Duplicate (LCSD) is also included in the QC batch. An LCSD is a QC sample that is created and handled identically to the LCS. Analyte recovery data from the LCSD is assessed in the same way as that of the LCS. The LCSD recoveries, together with the LCS recoveries, are used to determine the reproducibility (precision) of the analytical system. Precision data are expressed as relative percent differences (RPDs). If the RPD fails for an LCS/LCSD and yet the recoveries are within acceptance criteria, the batch is still acceptable.

METHOD BLANK

The Method Blank is a QC sample consisting of all the reagents used in analyzing the environmental samples contained in the QC batch. Method Blank results are used to determine if interference or contamination in the analytical system could lead to the reporting of false positive data or elevated analyte concentrations. All target analytes must be below the reporting limits (RL) or the associated sample(s) must be ND except under the following circumstances:

- Common organic contaminants may be present at concentrations up to 5 times the reporting limits. Common metals contaminants may be present at concentrations up to 2 times the reporting limit, or the reported blank concentration must be twenty fold less than the concentration reported in the associated environmental samples. (See common laboratory contaminants listed in the table.)

<u>Volatile (GC or GC/MS)</u>	<u>Semivolatile (GC/MS)</u>	<u>Metals ICP-MS</u>	<u>Metals ICP Trace</u>
Methylene Chloride, Acetone, 2-Butanone	Phthalate Esters	Copper, Iron, Zinc, Lead, Calcium, Magnesium, Potassium, Sodium, Barium, Chromium, Manganese	Copper, Iron, Zinc, Lead

QUALITY CONTROL ELEMENTS NARRATIVE (continued)

- Organic blanks will be accepted if compounds detected in the blank are present in the associated samples at levels 10 times the blank level. Inorganic blanks will be accepted if elements detected in the blank are present in the associated samples at 20 times the blank level.
- Blanks will be accepted if the compounds/elements detected are not present in any of the associated environmental samples.

Failure to meet these Method Blank criteria requires the reparation and reanalysis of all samples in the QC batch.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE

A Matrix Spike and a Matrix Spike Duplicate are a pair of environmental samples to which known concentrations of a full or partial set of target analytes are added. The MS/MSD results are determined in the same manner as the results of the environmental sample used to prepare the MS/MSD. The analyte recoveries and the relative percent differences (RPDs) of the recoveries are calculated and used to evaluate the effect of the sample matrix on the analytical results. Due to the potential variability of the matrix of each sample, the MS/MSD results may not have an immediate bearing on any samples except the one spiked; therefore, the associated batch MS/MSD may not reflect the same compounds as the samples contained in the analytical report. When these MS/MSD results fail to meet acceptance criteria, the data is evaluated. If the LCS is within acceptance criteria, the batch is considered acceptable.

For certain methods, a Matrix Spike/Sample Duplicate (MS/DU) may be included in the QC batch in place of the MS/MSD. For the parameters (i.e. pH, ignitability) where it is not possible to prepare a spiked sample, a Sample Duplicate may be included in the QC batch. However, a Sample Duplicate is less likely to provide usable precision statistics depending on the likelihood of finding concentrations below the standard reporting limit. When the Sample Duplicate result fails to meet acceptance criteria, the data is evaluated.

For certain methods (600 series methods/CWA), a Matrix Spike is required in place of a Matrix Spike/Matrix Spike Duplicate (MS/MSD) or Matrix Spike/Sample Duplicate (MS/DU).

The acceptance criteria do not apply to samples that are diluted.

SURROGATE COMPOUNDS

In addition to these batch-related QC indicators, each organic environmental and QC sample is spiked with surrogate compounds. Surrogates are organic chemicals that behave similarly to the analytes of interest and that are rarely present in the environment. Surrogate recoveries are used to monitor the individual performance of a sample in the analytical system.

If surrogate recoveries are biased high in the LCS, LCSD, or the Method Blank, and the associated sample(s) are ND, the batch is acceptable. Otherwise, if the LCS, LCSD, or Method Blank surrogate(s) fail to meet recovery criteria, the entire sample batch is reprepared and reanalyzed. If the surrogate recoveries are outside criteria for environmental samples, the samples will be reprepared and reanalyzed unless there is objective evidence of matrix interference or if the sample dilution is greater than the threshold outlined in the associated method SOP.

The acceptance criteria do not apply to samples that are diluted. All other surrogate recoveries will be reported.

For the GC/MS BNA methods, the surrogate criterion is that two of the three surrogates for each fraction must meet acceptance criteria. The third surrogate must have a recovery of ten percent or greater.

For the Pesticide and PCB methods, the surrogate criterion is that one of two surrogate compounds must meet acceptance criteria. The second surrogate must have a recovery of 10% or greater.

TestAmerica Certifications and Approvals:

The laboratory is certified for the analytes listed on the documents below. These are available upon request.
California (#01144CA), Connecticut (#PH-0590), Florida (#E87225),
Illinois (#200004), Kansas (#E10336), Minnesota (#39-999-348), New Jersey (#OH001), New York (#10975), Nevada
(#OH-000482008A), OhioVAP (#CL0024), Pennsylvania (#008), West Virginia (#210), Wisconsin (#999518190), NAVY,
ARMY, USDA Soil Permit

NOTE(S) :

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

CASE NARRATIVE

Client: TRW Automotive

Project: TRW-OU2 - Oak Grove Village

Report Number: 240-18654-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6020 Strontium analysis was performed at the TestAmerica Pittsburgh Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client.

RECEIPT

The samples were received on 12/12/2012; the samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 1.6 C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MW-105(20121210) (240-18654-1), MW-101(20121210) (240-18654-3) and TRIP BLANK (240-18654-4) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 12/19/2012.

Several analytes were detected in method blank MB 240-69407/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

No other difficulties were encountered during the VOCs analyses.

All other quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICP)

Sample MW-105(20121210) (240-18654-1) was analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 12/20/2012 and analyzed on 12/21/2012.

No difficulties were encountered during the metals analysis.

All quality control parameters were within the acceptance limits.

Several analytes were detected in method blank MB 240-69534/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

DISSOLVED METALS (ICPMS)

Sample MW-105(20121210) (240-18654-1) was analyzed for dissolved metals (ICPMS) in accordance with EPA SW-846 Method 6020.

The samples were prepared on 02/04/2013 and analyzed on 02/06/2013.

No difficulties were encountered during the metals analysis.

All quality control parameters were within the acceptance limits.

Strontium was detected in method blank MB 180-62876/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

ALKALINITY

Samples MW-105(20121210) (240-18654-1) and MW-101(20121210) (240-18654-3) were analyzed for alkalinity in accordance with SM 2320B. The samples were analyzed on 12/17/2012.

Alkalinity failed the recovery criteria low for the MS/MSD of sample 240-18659-1 in batch 240-69192.

Refer to the QC report for details.

No other difficulties were encountered during the alkalinity analyses.

All other quality control parameters were within the acceptance limits.

DISSOLVED AMMONIA

Sample MW-105(20121210) (240-18654-1) was analyzed for dissolved ammonia in accordance with SM 4500 NH3 F. The samples were analyzed on 12/27/2012.

No difficulties were encountered during the ammonia analysis.

All quality control parameters were within the acceptance limits.

Ammonia was detected in method blank MB 240-70347/7 at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

DISSOLVED PHOSPHORUS

Sample MW-105(20121210) (240-18654-1) was analyzed for dissolved phosphorus in accordance with SM 4500 P E. The samples were prepared and analyzed on 12/31/2012.

No difficulties were encountered during the phosphorus analysis.

All quality control parameters were within the acceptance limits.

DISSOLVED ANIONS

Sample MW-105(20121210) (240-18654-1) was analyzed for dissolved anions in accordance with EPA SW-846 Method 9056A. The samples were analyzed on 12/12/2012.

No difficulties were encountered during the anions analysis.

All quality control parameters were within the acceptance limits.

Nitrite as N and Orthophosphate failed the recovery criteria low for the MSD of sample 240-18605-2 in batch 240-68286. Orthophosphate exceeded the rpd limit.

Refer to the QC report for details.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

DISSOLVED ANIONS

Sample MW-105(20121210) (240-18654-1) was analyzed for dissolved anions in accordance with EPA SW-846 Method 9056A. The samples were analyzed on 12/12/2012 and 12/31/2012.

No difficulties were encountered during the anions analysis.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: TRW Automotive

Job Number: 240-18654-1

Lab Section	Qualifier	Description
GC/MS VOA	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Question	Answer	Comment
Radioactivity wasn't checked or is \leq background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is $<6\text{mm}$ ($1/4"$).	N/A	
Multiphasic samples are not present.	N/A	
Samples do not require splitting or compositing.	N/A	
Residual Chlorine Checked.	N/A	

ANALYTICAL REPORT

CASE NARRATIVE

Client: TRW Automotive

Project: TRW- OU2 - Oak Grove Village

Report Number: 240-18762-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

The 6020 Strontium analysis was performed at the TestAmerica Pittsburgh Laboratory.

TestAmerica Canton attests to the validity of the laboratory data generated by TestAmerica facilities reported herein. All analyses performed by TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results are reported on an "as received" basis unless otherwise indicated by the presence of a % solids value in the method header.

This laboratory report is confidential and is intended for the sole use of TestAmerica and its client

RECEIPT

The samples were received on 12/13/2012 9:15 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 3.6° C and 4.8° C.

VOLATILE ORGANIC COMPOUNDS (GC-MS)

Samples MW-107S(121212) (240-18762-1), MW-107D(121212) (240-18762-2), TRIP BLANK (240-18762-3) and MW-108D(121212) (240-18762-4) were analyzed for volatile organic compounds (GC-MS) in accordance with EPA SW-846 Method 8260B. The samples were analyzed on 12/20/2012 and 12/21/2012.

1,2,3-Trichlorobenzene, 1,2,4-Trichlorobenzene and Hexachlorobutadiene were detected in method blank MB 240-69586/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

1,2,3-Trichlorobenzene, Hexachlorobutadiene and Naphthalene were detected in method blank MB 240-69796/5 at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

1,1,2,2-Tetrachloroethane, 1,1,2-Trichloroethane, 1,2,3-Trichloropropane, 1,3-Dichloropropane and N-Propylbenzene failed the recovery criteria high for LCS 240-69586/4. Refer to the QC report for details.

1,1,1-Trichloroethane failed the recovery criteria low for the MSD of sample MW-107D(121212)MSD (240-18762-2) in batch 240-69586.

Tetrachloroethene and Trichloroethene failed the recovery criteria high for the MS of sample 240-18800-4 in batch 240-69796.

The presence of the '4' qualifier in the data indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Refer to the QC report for details.

Samples MW-107S(121212) (240-18762-1)[2X] and MW-108D(121212) (240-18762-4)[2X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No other difficulties were encountered during the VOCs analyses.

All other quality control parameters were within the acceptance limits.

DISSOLVED METALS (ICP)

Samples MW-107S(121212) (240-18762-1), MW-107D(121212) (240-18762-2) and MW-108D(121212) (240-18762-4) were analyzed for dissolved metals (ICP) in accordance with EPA SW-846 Method 6010B. The samples were prepared on 12/27/2012 and 12/28/2012 and analyzed on 12/28/2012 and 12/30/2012.

No difficulties were encountered during the metals analyses.

All quality control parameters were within the acceptance limits.

Several analytes were detected in method blank MB 240-70176/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged.

Several analytes were detected in method blank MB 240-70398/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

SiO₂, Silica failed the recovery criteria low for the MS of sample 240-18839-3 in batch 240-70550.

SiO₂, Silica failed the recovery criteria high for the MSD of sample 240-18839-3 in batch 240-70550.

Refer to the QC report for details.

DISSOLVED METALS (ICPMS)

Samples MW-107S(121212) (240-18762-1), MW-107D(121212) (240-18762-2) and MW-108D(121212) (240-18762-4) were analyzed for dissolved metals (ICPMS) in accordance with EPA SW-846 Method 6020. The samples were prepared on 02/04/2013 and analyzed on 02/06/2013.

No difficulties were encountered during the metals analyses.

All quality control parameters were within the acceptance limits.

Strontium was detected in method blank MB 180-62876/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged "J". If the associated sample reported a result above the MDL and/or RL, the result has been "B" flagged. Refer to the QC report for details.

ALKALINITY

Samples MW-107S(121212) (240-18762-1), MW-107D(121212) (240-18762-2) and MW-108D(121212) (240-18762-4) were analyzed for alkalinity in accordance with SM 2320B. The samples were analyzed on 12/18/2012.

No difficulties were encountered during the alkalinity analyses.

All quality control parameters were within the acceptance limits.

DISSOLVED AMMONIA

Samples MW-107S(121212) (240-18762-1), MW-107D(121212) (240-18762-2) and MW-108D(121212) (240-18762-4) were analyzed for dissolved ammonia in accordance with SM 4500 NH₃ F. The samples were analyzed on 12/31/2012.

No difficulties were encountered during the ammonia analyses.

All quality control parameters were within the acceptance limits.

DISSOLVED PHOSPHORUS

Samples MW-107S(121212) (240-18762-1), MW-107D(121212) (240-18762-2) and MW-108D(121212) (240-18762-4) were analyzed for dissolved phosphorus in accordance with SM 4500 P E. The samples were prepared and analyzed on 01/03/2013.

No difficulties were encountered during the phosphorus analyses.

All quality control parameters were within the acceptance limits.

DISSOLVED ANIONS

Samples MW-107S(121212) (240-18762-1), MW-107D(121212) (240-18762-2) and MW-108D(121212) (240-18762-4) were analyzed for dissolved anions in accordance with EPA SW-846 Method 9056A. The samples were analyzed on 12/13/2012.

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 68642 for orthophosphate were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria. The MS/MSD pair also met RPD criteria. Since the sample is now out of hold the results are reported.

Orthophosphate failed the recovery criteria high for the MS of sample MW-107D(121212)MS (240-18762-2) in batch 240-68642.

Orthophosphate failed the recovery criteria high for the MSD of sample MW-107D(121212)MSD (240-18762-2) in batch 240-68642.

Refer to the QC report for details.

No other difficulties were encountered during the anions analyses.

All other quality control parameters were within the acceptance limits.

DISSOLVED ANIONS

Samples MW-107S(121212) (240-18762-1), MW-107D(121212) (240-18762-2) and MW-108D(121212) (240-18762-4) were analyzed for dissolved anions in accordance with EPA SW-846 Method 9056A. The samples were analyzed on 12/13/2012.

No difficulties were encountered during the anions analyses.

All quality control parameters were within the acceptance limits.

DATA REPORTING QUALIFIERS

Client: TRW Automotive

Job Number: 240-18762-1

Lab Section	Qualifier	Description
GC/MS VOA	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	*	LCS or LCSD exceeds the control limits
	F	MS or MSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
Metals	B	Compound was found in the blank and sample.
	U	Indicates the analyte was analyzed for but not detected.
	4	MS, MSD: The analyte present in the original sample is 4 times greater than the matrix spike concentration; therefore, control limits are not applicable.
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
General Chemistry	U	Indicates the analyte was analyzed for but not detected.
	F	MS or MSD exceeds the control limits
	J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
